Foreword

ISO (the International Organization for Standardization) and IEC (the International Electrotechnical Commission) form the specialized system for worldwide standardization. National bodies that are members of ISO or IEC participate in the development of International Standards through technical committees established by the respective organization to deal with particular fields of technical activity. ISO and IEC technical committees collaborate in fields of mutual interest. Other international organizations, governmental and non-governmental, in liaison with ISO and IEC, also take part in the work. In the field of information technology, ISO and IEC have established a joint technical committee, ISO/IEC JTC1.

International Standards are drafted in accordance with the rules given in the ISO/IEC Directives, Part 2.

The main task of the joint technical committee is to prepare International Standards. Draft International Standards adopted by the joint technical committee are circulated to national bodies for voting. Publication as an International Standard requires approval by at least 75% of the national bodies casting a vote.

Attention is drawn to the possibility that some of the elements of ISO/IEC 10646 may be the subject of patent rights. ISO and IEC shall not be held responsible for identifying any or all such patent rights.

International Standard ISO/IEC 10646 was prepared by Joint Technical Committee ISO/IEC JTC1, Information technology, Subcommittee SC 2, Coded Character sets.

This second edition of ISO/IEC 10646 cancels and replaces ISO/IEC 10646:2003. It also incorporates ISO/IEC 10646:2003 Amd.1:2005, Amd.2:2006, Amd.3:2007, Amd.4:2008, Amd.5:2009, Amd.6:2010, Amd.7:2011, and Amd.8 2011.

NOTE – Amendment 7 and 8 are still in progress. The text in this document is synchronized with their contents and will be updated accordingly.

Introduction

ISO/IEC 10646 specifies the Universal Coded Character Set (UCS). It is applicable to the representation, transmission, interchange, processing, storage, input and presentation of the written form of the languages of the world as well as additional symbols.

By defining a consistent way of encoding multilingual text it enables the exchange of data internationally. The information technology industry gains data stability, greater global interoperability and data interchange. ISO/IEC 10646 has been widely adopted in new Internet protocols and implemented in modern operating systems and computer languages. This edition covers over 109 000 characters from the world's scripts.

ISO/IEC 10646 contains material which may only be available to users who obtain their copy in a machine readable format. That material consists of the following printable files:

- EmojiSrc.txt
- CJKU_SR.txt
- CJKC_SR.txt
- NUSI.txt
- IICORE.txt
- JIEx.txt
- Allnames.txt
- HangulSy.txt.

Information technology — Universal Coded Character Set (UCS) —

1 Scope

ISO/IEC 10646 specifies the Universal Coded Character Set (UCS). It is applicable to the representation, transmission, interchange, processing, storage, input, and presentation of the written form of the languages of the world as well as of additional symbols.

This document

- specifies the architecture of ISO/IEC 10646,
- defines terms used in ISO/IEC 10646,
- describes the general structure of the UCS codespace,
- specifies the Basic Multilingual Plane (BMP) of the UCS,
- specifies supplementary planes of the UCS: the Supplementary Multilingual Plane (SMP), the Supplementary Ideographic Plane (SIP), the Tertiary Ideographic Plane (TIP), and the Supplementary Special-purpose Plane (SSP),
- defines a set of graphic characters used in scripts and the written form of languages on a world-wide scale,
- specifies the names for the graphic characters and format characters of the BMP, SMP, SIP, TIP, SSP and their coded representations within the UCS codespace,
- specifies the coded representations for control characters and private use characters,
- specifies three encoding forms of the UCS: UTF-8, UTF-16, and UTF-32,
- specifies seven encoding schemes of the UCS: UTF-8, UTF-16, UTF-16BE, UTF-16LE, UTF-32, UTF-32BE, and UTF-32LE,
- specifies the management of future additions to this coded character set.

The UCS is an encoding system different from that specified in ISO/IEC 2022. The method to designate UCS from ISO/IEC 2022 is specified in 12.2.

A graphic character will be assigned only one code point in the standard, located either in the BMP or in one of the supplementary planes.

NOTE – The Unicode Standard, Version 6.0 includes a set of characters, names, and coded representations that are identical with those in this International Standard. It additionally provides details of character properties, processing algorithms, and definitions that are useful to implementers.

2 Conformance

2.1 General

Whenever private use characters are used as specified in ISO/IEC 10646, the characters themselves shall not be covered by these conformance requirements.

2.2 Conformance of information interchange

A coded-character-data-element (CC-data-element) within coded information for interchange is in conformance with ISO/IEC 10646 if

- a) all the coded representations of graphic characters within that CC-data-element conform to clause 6, to an identified encoding form chosen from clause 9, and to an identified encoding scheme chosen from clause 10;
- b) all the graphic characters represented within that CC-data-element are taken from those within an identified subset (see 8);
- c) all the coded representations of control functions within that CC-data-element conform to clause 11.

A claim of conformance shall identify the adopted encoding form, the adopted encoding scheme, and the adopted subset by means of a list of collections and/or characters.

2.3 Conformance of devices

A device is in conformance with ISO/IEC 10646 if it conforms to the requirements of item a) below, and either or both of items b) and c).

A claim of conformance shall identify the document that contains the description specified in a) below, and shall identify the adopted encoding form(s), the adopted encoding scheme(s), and the adopted subset (by means of a list of collections and/or characters), and the selection of control functions adopted in accordance with clause 11.

- a) **Device description:** A device that conforms to ISO/IEC 10646 shall be the subject of a description that identifies the means by which the user may supply characters to the device and/or may recognize them when they are made available to the user, as specified respectively, in subclauses b) and c) below.
- b) **Originating device:** An originating device shall allow its user to supply any characters from an adopted subset, and be capable of transmitting their coded representations within a CC-data-element in accordance with the adopted encoding form and adopted encoding scheme. As such, the originating device shall not emit ill-formed CC-data-elements.
- c) **Receiving device:** A receiving device shall be capable of receiving and interpreting any coded representation of characters that are within a CC-data-element in accordance with the adopted encoding form and the adopted encoding scheme, and shall make any corresponding characters from the adopted subset available to the user in such a way that the user can identify them. The receiving device shall treat ill-formed CC-data-elements as an error condition and shall not interpret such data as character sequences.

Any corresponding characters that are not within the adopted subset shall be indicated to the user. The way used for indicating them need not distinguish them from each other.

NOTE 1 – The manner in which a user is notified of either an error condition or characters not within the adopted subset is not specified by this standard.

NOTE 2 – See also Annex J for receiving devices with retransmission capability.

3 Normative references

The following normative documents contain provisions which, through reference in this text, constitute provisions of ISO/IEC 10646. For dated references, subsequent amendments to, or revisions of, any of these publications do not apply. However, parties to agreements based on ISO/IEC 10646 are encouraged to investigate the possibility of applying the most recent editions of the normative documents indicated below. For undated references, the latest edition of the normative document referred to applies. Members of ISO and IEC maintain registers of currently valid International Standards.

Editor's Note: The versions for the Unicode Standard Annexes mentioned above will be updated as appropriate in future phases of this standard process.

4 Terms and definitions

For the purposes of ISO/IEC 10646, the following terms and definitions apply.

4.1

Base character

A graphic character which is not a combining character

NOTE 1 – Most graphic characters are base characters. This sense of graphic combination does not preclude the presentation of base characters from adopting different contextual forms or from participating in ligatures.

NOTE 2 – A base character typically does not graphically combine with preceding characters. They may be exceptions for some complex writing systems.

4.2

Basic Multilingual Plane

BMP

Plane 00 of the UCS codespace

4.3

Block

A contiguous range of code points to which a set of characters that share common characteristics, such as a script, are allocated; a block does not overlap another block; one or more of the code points within a block may have no character allocated to them

4.4

Canonical form

The form with which characters of this coded character set is specified using a single code point within the UCS codespace

NOTE – The canonical form should not be confused with an encoding form which describes the relationship between UCS code points and one or several code units (see 4.23).

4.5

CC-data-element

coded-character-data-element

An element of interchanged information that is specified to consist of a sequence of code units, in accordance with one or more identified standards for coded character sets; such sequence may contain code units associated with any type of code points

NOTE – Unlike previous editions of the standard, this version no longer uses implementation levels. Its definition of CC-data-element content corresponds to the former unrestricted implementation level 3. Other definitions of CC-data-element content, previously known as level 1 and 2, are deprecated. To maintain compatibility with these previous editions, in the context of identification of coded representation in standards such as ISO/IEC 8824 and ISO/IEC 8825, the concept of implementation level may still be referenced as 'Implementation level 3'. See Annex N.

4.6

Character

A member of a set of elements used for the organization, control, or representation of textual data; a character may be represented by a sequence of one or several coded characters

4.7

Character boundary

Within a CC-data-element the demarcation between the last code unit of a coded character and the first code unit of the next coded character

4.8

Code chart

Code table

A rectangular array showing the representation of coded characters allocated within a range of the UCS codespace

4.9

Coded character

An association between a character and a code point

4.10

Coded character set

A set of coded characters

4.11

Code point

Code position

Any value in the UCS codespace; the term code point is preferred

4.12

Code unit

The minimal bit combination that can represent a unit of encoded text for processing or interchange

NOTE – Examples of code units are octets (8-bit code units) used in the UTF-8 encoding form, 16-bit code units in the UTF-16 encoding form, and 32-bit code units in the UTF-32 encoding form.

4.13

Collection

A numbered and named set of entities; for a non extended collection, these entities consist only of those coded characters whose code points lie within one or more identified ranges (see also 4.25 for extended collection)

NOTE – If any of the identified ranges include code points to which no character is allocated, the repertoire of the collection will change if an additional character is assigned to any of those code points at a future amendment of this International Standard. However it is intended that the collection number and name will remain unchanged in future editions of this International Standard.

4.14

Combining character

Characters which have General Category values of Spacing Combining Mark (Mc), Non Spacing Mark (Mn), and Enclosing Mark (Me)

NOTE – These characters are intended for combination with the preceding non-combining graphic character, or with a sequence of combining characters preceded by a non-combining character (see also 4.17).

4.15

Combining class

Value associated with each combining character determining its typographical interaction and its canonical ordering within a sequence of combining characters

4.16

Compatibility character

A graphic character included as a coded character of ISO/IEC 10646 primarily for compatibility with existing coded character sets

4.17**Composite sequence**

A sequence of graphic characters consisting of a base character followed by one or more combining characters, ZERO WIDTH JOINER, or ZERO WIDTH NON-JOINER (see also 4.14)

NOTE 1 – A graphic symbol for a composite sequence generally consists of the combination of the graphic symbols of each character in the sequence.

NOTE 2 – A composite sequence may be used to represent characters not encoded in the repertoire of ISO/IEC 10646

4.18**Control character**

A control function the coded representation of which consists of a single code point

NOTE – Although control characters are often ‘named’ using terms such as DELETE, FORM FEED, ESC, these qualifiers do not correspond to formal character names. See 11 for a list of the long names used by ISO/IEC 6429 in association with the control characters.

4.19**Control function**

An action that affects the recording, processing, transmission, or interpretation of data, and that is represented by a CC-data-element

4.20**Decomposition mapping**

A mapping from a character to a sequence of one or more characters that is a canonical or compatibility equivalent

4.21**Default state**

The state that is assumed when no state has been explicitly specified (see F.2.1 and F.2.3)

4.22**Device**

A component of information processing equipment which can transmit and/or receive coded information within CC-data-elements (It may be an input/output device in the conventional sense, or a process such as an application program or gateway function.)

4.23**Encoding form**

An encoding form determines how each UCS code point for a UCS character is to be expressed as one or more code units used by the encoding form. ISO/IEC 10646 specifies UTF-8, UTF-16, and UTF-32

4.24**Encoding scheme**

An encoding scheme specifies the serialization of the code units from the encoding form into octets

NOTE – Some of the UCS encoding schemes have the same labels as the UCS encoding form. However they are used in different context. UCS encoding forms refer to in-memory and application interface representation of textual data. UCS encoding schemes refer to octet-serialized textual data.

4.25**Extended collection**

A collection for which the entities can also consist of sequences of code points that are in normalization form NFC (see 21); the sequences of code points are referenced by Named UCS Sequence Identifiers (NUSI) (see 125).

NOTE – Some collections such as 3 LATIN EXTENDED-A, 4 LATIN EXTENDED-B, 15 ARABIC EXTENDED, and many more, have the term ‘extended’ in their name. This does not make them extended collections

4.26

Fixed collection

A collection in which every code point within the identified range(s) has a character allocated to it, and which is intended to remain unchanged in future editions of this International Standard

4.27

Format character

A character whose primary function is to affect the layout or processing of characters around it; it generally does not have a visible representation of its own

4.28

General Category

GC

Value assigned to each UCS code point which determines its major class, such as letter, punctuation, and symbol; each value is defined as General Category property using a two-letter abbreviation in the Unicode Standard (see reference to the Unicode Standard General Category in 3)

NOTE – When referred as a group containing all GC values sharing the same first letter, the group may be described using the first letter only. For example, 'L' stands for all letters 'Lu', 'Ll', 'Lt', 'Lm', and 'Lo'.

4.29

Graphic character

A character, other than a control function or a format character, that has a visual representation normally handwritten, printed, or displayed

4.30

Graphic symbol

The visual representation of a graphic character or of a composite sequence

4.31

High-surrogate code point

A code point in the range D800 to DBFF reserved for the use of UTF-16

4.32

High-surrogate code unit

A 16-bit code unit in the range D800 to DBFF used in UTF-16 as the leading code unit of a surrogate pair (see 9.2)

4.33

ill-formed CC-data-element

A UCS CC-data-element that purports to be in a UCS encoding form which does not conform to the specification of that encoding form (for example, an unpaired surrogate code unit is an ill-formed CC-data-element)

4.34

ill-formed CC-data-element subset

A non-empty subset of a CC-data-element X which does not contain any code unit which also belong to any minimal well-formed CC-data-element subset of X

NOTE – An ill-formed CC-data-element subset cannot overlap with a minimal well-formed CC-data-element.

4.35

Interchange

The transfer of character coded data from one user to another, using telecommunication means or interchangeable media; interchange implies data serialization and the usage of a UCS encoding scheme

4.36

Interworking

The process of permitting two or more systems, each employing different coded character sets, to meaningfully interchange character coded data; conversion between the two codes may be involved

4.37**ISO/IEC 10646-1**

A former subdivision of the standard. It is also referred to as Part 1 of ISO/IEC 10646 and contained the specification of the overall architecture and the Basic Multilingual Plane (BMP). There are a First and a Second Edition of ISO/IEC 10646-1.

4.38**ISO/IEC 10646-2**

A former subdivision of the standard. It is also referred to as Part 2 of ISO/IEC 10646 and contained the specification of the Supplementary Multilingual Plane (SMP), the Supplementary Ideographic Plane (SIP) and the Supplementary Special-purpose Plane (SSP). There is only a First Edition of ISO/IEC 10646-2.

4.39**Low-surrogate code point**

A code point in the range DC00 to DFFF reserved for the use of UTF-16

4.40**Low-surrogate code unit**

A 16-bit code unit in the range DC00 to DFFF used in UTF-16 as the trailing code unit of a surrogate pair (see 9.2)

4.41**Minimal well-formed CC-data-element**

A well-formed CC-data-element that maps to a single UCS scalar value

4.42**Mirrored character**

A character whose image is mirrored horizontally in text that is laid out from right to left

4.43**Octet**

A 8-bit code unit; the value is expressed in hexadecimal notation from 00 to FF in ISO/IEC 10646 (see Annex K)

4.44**Plane**

A subdivision of the UCS codespace consisting of 65536 code points. The UCS codespace contain 17 planes

4.45**Presentation
to present**

The process of writing, printing, or displaying a graphic symbol

4.46**Presentation form**

In the presentation of some scripts, a form of a graphic symbol representing a character that depends on the position of the character relative to other characters

4.47**Private use plane**

A plane within this coded character set; the contents of which is not specified in ISO/IEC 10646. Planes 0F and 10 are private use planes

4.48**Repertoire**

A specified set of characters that are represented in a coded character set

4.49

Row

A subdivision of a plane; a multiple of 256 code points

4.50

Script

A set of graphic characters used for the written form of one or more languages

4.51

Supplementary plane

A plane other than Plane 00 of the UCS codespace; a plane that accommodates characters which have not been allocated to the Basic Multilingual Plane

4.52

Supplementary Multilingual Plane for scripts and symbols

SMP

Plane 01 of the UCS codespace

4.53

Supplementary Ideographic Plane

SIP

Plane 02 of the UCS codespace

4.54

Supplementary Special-purpose Plane

SSP

Plane 0E of the UCS codespace

4.55

Surrogate pair

A representation for a single character that consists of a sequence of two 16-bit code units, where the first value of the pair is a high-surrogate code unit and the second value is a low-surrogate code unit

4.56

Tertiary Ideographic Plane

TIP

Plane 03 of the UCS codespace

4.57

UCS codespace

The UCS codespace consists of the integers from 0 to 10FFFF (hexadecimal) available for assigning the repertoire of the UCS characters

4.58

UCS scalar value

Any UCS code point except high-surrogate and low-surrogate code points

4.59

Unpaired surrogate code unit

A surrogate code unit in a CC-data element that is either a high-surrogate code unit that is not immediately followed by a low-surrogate unit, or a low-surrogate code unit that is not immediately preceded by a high-surrogate code unit

4.60

User

A person or other entity that invokes the service provided by a device (This entity may be a process such as an application program if the “device” is a code converter or a gateway function, for example.)

4.61**Well-formed CC-data-element**

A UCS CC-data-element that purports to be in a UCS encoding form which conforms to the specification of that encoding form and contains no ill-formed CC-data-element subset

5 General structure of the UCS

The general structure of the Universal Coded Character Set (referred to hereafter as “this coded character set”) is described in this explanatory clause, and is illustrated in figure 1. The normative specification of the structure is given in the following clauses.

The canonical form of this coded character set – the way in which it is to be conceived – uses the UCS codespace which consists of the integers from 0 to 10FFFF.

ISO/IEC 10646 defines coded characters for the following planes:

- The Basic Multilingual Plane (BMP, Plane 00).
- The Supplementary Multilingual Plane for scripts and symbols (SMP, Plane 01).
- The Supplementary Ideographic Plane (SIP, Plane 02).
- The Supplementary Special-purpose Plane (SSP, Plane 0E).

The Tertiary Ideographic Plane (TIP, Plane 03) is reserved for ideographic characters and is currently empty. The planes from 04 to 0D are reserved for future standardization.

The planes 0F and 10 are reserved for private use.

Subsets of the coding space may be used in order to give a sub-repertoire of graphic characters.

6 Basic structure and nomenclature**6.1 Structure**

The Universal Coded Character Set as specified in ISO/IEC 10646 shall be regarded as a single entity made of 17 planes.

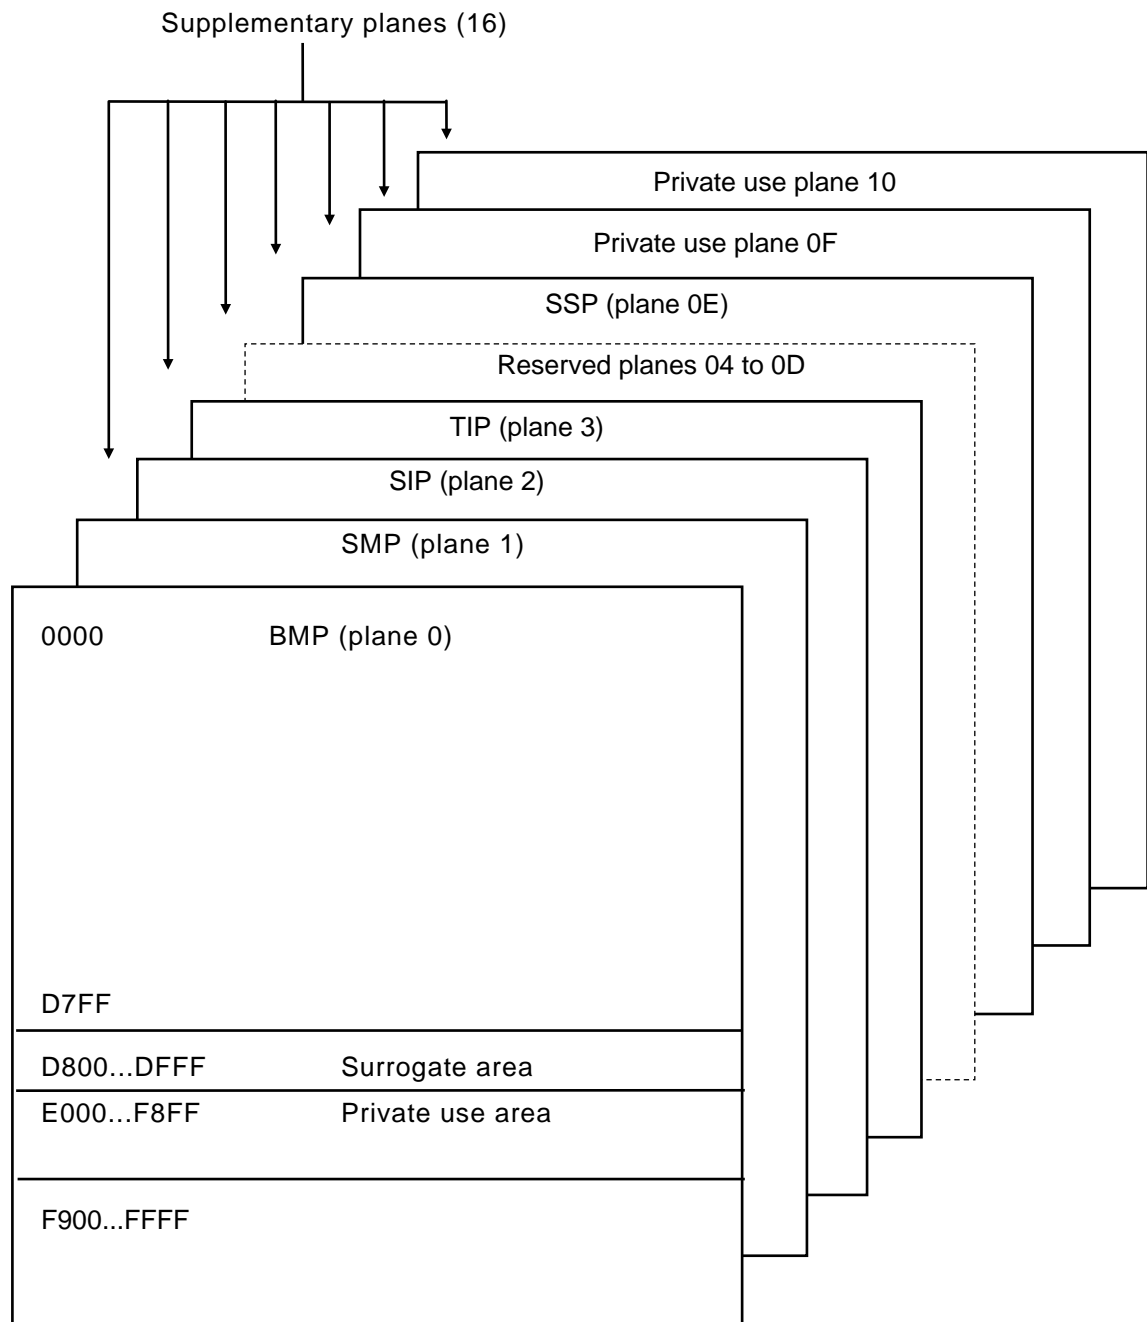

Figure 1 - Planes of the Universal Coded Character Set

6.2 Coding of characters

Each encoded character within the UCS codespace is represented by an integer between 0 and 10FFFF identified as code point.

When a single character is to be identified in term of its code point, it is represented by a six digit form of the integer such as

```
000030    for DIGIT ZERO
000041    for LATIN CAPITAL LETTER A
010000    for LINEAR B SYLLABLE B008 A
```

When referring to characters within plane 00, the leading two digits may be omitted; for characters within planes 01 to 0F, the leading digit may be omitted, such as

```
0030      for DIGIT ZERO
0041      for LATIN CAPITAL LETTER A
10000     for LINEAR B SYLLABLE B008 A
```

6.3 Types of code points

6.3.1 Classification

UCS code points are categorized in basic types, according to their General Category value. The Table 1 summarizes the types:

Table 1: Type of code points

Basic Type	Brief Description	General Category	Character status	Code point status
Graphic	Letter, mark, number, punctuation, symbols, and spaces	L, M, N, P, S, Zs	Assigned to character	Assigned code point
Format	Invisible, but affects neighbouring characters	Cf, Zl, Zp		
Control	Control functions consisting of a single code point	Cc		
Private use	Usage defined by private agreement outside this standard	Co		
Surrogate	Permanently reserved for UTF-16	Cs	Not assigned to character	Unassigned code point
Noncharacter	Permanently reserved for internal usage	Cn		
Reserved	Reserved for future assignment			

Surrogate, noncharacter, and reserved code points are not assigned to characters and are subject to restriction in interchange. For example, surrogate code points do not have well-formed representations in any UCS encoding form.

6.3.2 Graphic characters

The same graphic character shall not be allocated to more than one code point. There are graphic characters with similar shapes in the coded character set; they are used for different purposes and have different character names.

6.3.3 Format characters

Format characters form a class of characters which are invisible but affect neighbouring characters.

6.3.4 Control characters

Code points 0000 to 001F, 007F to 009F in the BMP are reserved for control characters (see 11).

6.3.5 Private use characters

Code points from E000 to F8FF in the BMP are reserved for private use. All code points of Plane 0F and Plane 10, except for FFFFE, FFFFF, 10FFFE, and 10FFFF are reserved for private use.

Private use characters are not constrained in any way by ISO/IEC 10646. Private use characters can be used to provide user-defined characters. For example, this is a common requirement for users of ideographic scripts.

NOTE – For meaningful interchange of private use characters, an agreement, independent of ISO/IEC 10646, is necessary between sender and recipient.

6.3.6 Surrogate code points

Code points D800 to DFFF are reserved for the use of the UTF-16 encoding form (see 9.2). The first half (D800 to DBFF) contains the high-surrogate code points and the second half (DC00 to DFFF) contains the low-surrogate code points.

6.3.7 Noncharacter code points

The status of noncharacter code points cannot be changed by future amendments. Noncharacters consist of FDD0-FDEF and any code point ending in the value FFFE or FFFF.

NOTE – Code point FFFE is reserved for “signature”. Code points FDD0 to FDEF, and FFFF can be used for internal processing uses requiring numeric values which are guaranteed not to be coded characters, such as in terminating tables, or signaling end-of-text. Furthermore, since FFFF is the largest BMP value, it may also be used as the final value in binary or sequential searching index within the context of UTF-16.

6.3.8 Reserved code points

Reserved code points are reserved for future standardization and shall not be used for any other purpose. Future editions of ISO/IEC 10646 will not allocate any characters to these reserved code points.

6.4 Naming of characters

ISO/IEC 10646 assigns a unique name to each graphic and format character. The name of a character either

- a) denotes the customary meaning of the character, or
- b) describes the shape of the corresponding graphic symbol, or
- c) follows the rule given in 24.5 for Chinese /Japanese/Korean (CJK) ideographs, or
- d) follows the rule given in 24.6 for Hangul syllables.

Some characters may have one or more alternate names called character name aliases which are correction of the original names. Additional rules to be used for constructing the names of characters are given in 24.

The list of character names, except for CJK unified ideographs and Hangul syllables, is provided in 30.

NOTE – The list of character names is also part of the Unicode character Database in:
<http://www.unicode.org/Public/UNIDATA/NamesList.txt> with the syntax described in:
<http://www.unicode.org/Public/UNIDATA/NamesList.html>.

6.5 Short identifiers for code points (UIDs)

ISO/IEC 10646 defines short identifiers for each code point, including code points that are reserved (unassigned). A short identifier for any code point is distinct from a short identifier for any other code point. If a character is allocated at a code point, a short identifier for that code point can be used to refer to the character allocated at that code point.

NOTE 1 – For instance, U+DC00 identifies a surrogate code point, and U+FFFF identifies a noncharacter code point. U+0025 identifies a graphic code point to which a graphic character is allocated; U+0025 also identifies that character (named PERCENT SIGN).

NOTE 2 – These short identifiers are independent of the language in which this standard is written, and are thus retained in all translations of the text.

The following alternative forms of notation of a short identifier are defined here.

- a) The six-digit form of short identifier consists of the sequence of six hexadecimal digits that represents the code point of the character (see 6.2).
- b) The four-to-five-digit form of short identifier shall consist of the last four to five digits of the six-digit form. Leading zeroes beyond four digits are suppressed.
- c) The character “+” (PLUS SIGN) may, as an option, precede the digit form of short identifier.
- d) The prefix letter “U” (LATIN CAPITAL LETTER U) may, as an option, precede any of the three forms of short identifier defined in a) to c) above.

The capital letters A to F, and U that appear within short identifiers may be replaced by the corresponding small letters.

The full syntax of the notation of a short identifier, in Backus-Naur form, is

$$\{ U \mid u \} \{ + \} (xxxx \mid xxxxx \mid xxxxxx)$$

where “x” represents one hexadecimal digit (0 to 9, A to F, or a to f).

EXAMPLE

The short identifier for LATIN SMALL LETTER LONG S may be notated in any of the following forms:

017F +017F U017F U+017F

Any of the capital letters may be replaced by the corresponding small letter.

6.6 UCS Sequence Identifiers

ISO/IEC 10646 defines an identifier for any sequence of code points taken from the standard. Such an identifier is known as a UCS Sequence Identifier (USI). For a sequence of n code points it has the following form:

$$\langle \text{UID}_1, \text{UID}_2, \dots, \text{UID}_n \rangle$$

where UID_1 , UID_2 , etc. represent the short identifiers of the corresponding code points, in the same order as those code points appear in the sequence. If each of the code points in such a sequence has a character allocated to it, the USI can be used to identify the sequence of characters allocated at those code points. The syntax for UID_1 , UID_2 , etc. is specified in 6.5. A COMMA character (optionally followed by a SPACE character) separates the UIDs. The UCS Sequence Identifier includes at least two UIDs; it begins with a LESS-THAN SIGN and is terminated by a GREATER-THAN SIGN.

NOTE – UCS Sequences Identifiers cannot be used for specification of subset content. They may be used outside this standard to identify: composite sequences for mapping purposes, font repertoire, etc.

6.7 Octet sequence identifiers

To represent serialized octet in the context of the encoding schemes definition (see 10), ISO/IEC 10646 defines an identifier for serialized octet sequence. For a sequence of n octets it has the following form:

$$\langle \text{xx}_1 \text{xx}_2 \dots \text{xx}_n \rangle$$

where xx_1 , xx_2 , and xx_n , represents the first, second, and n^{th} octets using two hexadecimal digits for each octet.

7 Revision and updating of the UCS

The revision and updating of this coded character set will be carried out by ISO/IEC JTC1/SC2.

The names and code points allocation of all characters in this coded character set shall remain unchanged in all future editions and amendments of this standard. This also includes character name aliases.

NOTE – Character name aliases are created to denote errors in the character names which cannot be fixed after publication of the standard.

8 Subsets

ISO/IEC 10646 provides the specification of subsets of coded graphic characters for use in interchange, by originating devices, and by receiving devices.

There are two alternatives for the specification of subsets: limited subset and selected subset. An adopted subset may comprise either of them, or a combination of the two.

8.1 Limited subset

A limited subset consists of a list of graphic characters in the specified subset. This specification allows applications and devices that were developed using other codes to interwork with this coded character set.

A claim of conformance referring to a limited subset shall list the graphic characters in the subset by the names of graphic characters or code points as defined in ISO/IEC 10646.

8.2 Selected subset

A selected subset consists of a list of collections of graphic characters as defined in ISO/IEC 10646. The collections from which the selection may be made are listed in Annex A. A selected subset shall always automatically include the code points from 0020 to 007E.

A claim of conformance referring to a selected subset shall list the collections chosen as defined in ISO/IEC 10646.

9 UCS encoding forms

ISO/IEC 10646 provides three encoding forms expressing each UCS scalar value in a unique sequence of one or more code units. These are named UTF-8, UTF-16, and UTF-32 respectively.

9.1 UTF-8

UTF-8 is the UCS encoding form that assigns each UCS scalar value to an octet sequence of one to four octets, as specified in table 2.

- UCS characters from the BASIC LATIN collection are represented in UTF-8 in accordance with ISO/IEC 4873, i.e. single octets with values ranging from 20 to 7E.
- Control functions in code points from 0000 to 001F, and the control character in code point 007F, are represented without the padding octets specified in clause 11, i.e. as single octets with values ranging from 00 to 1F, and 7F respectively in accordance with ISO/IEC 4873 and with the 8-bit structure of ISO/IEC 2022.
- Octet values 00 to 7F do not otherwise occur in the UTF-8 coded representation of any character. This provides compatibility with existing file-handling systems and communications sub-systems which parse CC-sequences for these octet values.
- The first octet in the UTF-8 coded representation of any character can be directly identified when a CC-data-element is examined, one octet at a time, starting from an arbitrary location. It indicates the number of continuing octets (if any) in the multi-octet sequence that constitutes the code unit representation of that character.

Table 2 specifies the bit distribution for the UTF-8 encoding form, showing the ranges of UCS scalar values corresponding to one, two, three, and four octet sequences.

Table 2: UTF-8 Bit distribution

Scalar value	1 st octet	2 nd octet	3 rd octet	4 th octet
00000000xxxxxx	0xxxxxx			
0000yyyyxxxxxx	110yyyy	10xxxxx		
zzzzyyyyxxxxxx	1110zzzz	10yyyyy	10xxxxx	
000uuuuuzzzzyyyyxxxxxx	11110uuu	10uuzzzz	10yyyyy	10xxxxx

Because surrogate code points are not UCS scalar values, any UTF-8 sequence that would otherwise map to code points D800-DFFF is ill-formed.

Table 3 lists all the ranges (inclusive) of the octet sequences that are well-formed in UTF-8. Any UTF-8 sequence that does not match the patterns listed in table 3 is ill-formed

Table 3: Well-formed UTF-8 Octet sequences

Code points	1 st octet	2 nd octet	3 rd octet	4 th octet
0000-007F	00-7F			
0080-07FF	C2-DF	80-BF		
0800-0FFF	E0	A0-BF	80-BF	
1000-CFFF	E1-EC	80-BF	80-BF	
D000-D7FF	ED	80-9F	80-BF	
E000-FFFF	EE-EF	80-BF	80-BF	
10000-3FFFF	F0	90-BF	80-BF	80-BF
40000-FFFFFF	F1-F3	80-BF	80-BF	80-BF
100000-10FFFF	F4	80-8F	80-BF	80-BF

As a consequence of the well-formedness conditions specified in table 9.2, the following octet values are disallowed in UTF-8: C0-C1, F5-FE

9.2 UTF-16

UTF-16 is the UCS encoding form that assigns each UCS scalar value to a sequence of one to two unsigned 16-bit code units, as specified in table 4.

In the UTF-16 encoding form, code points in the range 0000-D7FF and E000-FFFF are represented as a single 16-bit code unit; code points in the range 10000-10FFFF are represented as pairs of 16-bit code units. These pairs of special code units are known as surrogate pairs.

The values of the code units used for surrogate pairs are disjoint from the code units used for the single code unit representation, thus maintaining non-overlap for all code point representations in UTF-16.

UTF-16 optimizes the representation of characters in the BMP which contains the vast majority of common use characters.

Because surrogate code points are not UCS scalar values, unpaired surrogate code units are ill-formed.

Table 4 specifies the bit distribution for the UTF-16 encoding form. Calculation of the surrogate pair values involves subtraction of 10000 hexadecimal to account for the starting offset to the scalar value (expressed as 'www = uuuu-1' in the table).

Table 4: UTF-16 Bit distribution

Scalar value	UTF-16
xxxxxxxxxxxxxxxx	xxxxxxxxxxxxxxxx
000uuuuuxxxxxxxxxxxxxxxx	110110wwwxxxxxx 110111xxxxxxxxxx

NOTE – Former editions of this standard included references to a two-octet BMP form called UCS-2 which would be a subset of the UTF-16 encoding form restricted to the BMP UCS scalar values. The UCS-2 form is deprecated.

9.3 UTF-32 (UCS-4)

UTF-32 (or UCS-4) is the UCS encoding form that assigns each UCS scalar value to a single unsigned 32-bit code unit. The terms UTF-32 and UCS-4 can be used interchangeably to designate this encoding form.

Because surrogate code points are not UCS scalar values, UTF-32 code units in the range 0000 D800-0000 DFFF are ill-formed.

10 UCS Encoding schemes

Encoding schemes are octet serializations specific to each UCS encoding form, including the specification of a signature, if allowed. The signature is the code unit sequence corresponding to the code point FEFF ZERO WIDTH NO-BREAK SPACE in the corresponding encoding form. When used, a signature at the beginning of a stream of serialized octets indicates the order of the octets within the encoding form used for the representation of the characters.

ISO/IEC 10646 specifies seven encoding schemes: UTF-8, UTF-16BE, UTF-16LE, UTF-16, UTF-32BE, UTF-32LE, and UTF-32.

10.1 UTF-8

The UTF-8 encoding scheme serializes a UTF-8 code unit sequence in exactly the same order as the code unit sequence itself.

When represented in UTF-8, the signature turns into the octet sequence <EF BB BF>. Its usage at the beginning of a UTF-8 data stream is neither required or recommended but does not affect conformance.

10.2 UTF-16BE

The UTF-16BE encoding scheme serializes a UTF-16 CC-data-element by ordering octets in a way that the more significant octet precedes the less significant octet (also known as big-endian ordering).

In UTF-16BE, an initial octet sequence of <FE FF> is interpreted as FEFF ZERO WIDTH NO-BREAK SPACE and does not convey a signature meaning.

10.3 UTF-16LE

The UTF-16LE encoding scheme serializes a UTF-16 CC-data-element by ordering octets in a way that the less significant octet precedes the more significant octet (also known as little-endian ordering).

In UTF-16LE, an initial octet sequence of <FF FE> is interpreted as FEFF ZERO WIDTH NO-BREAK SPACE and does not convey a signature meaning.

10.4 UTF-16

The UTF-16 encoding scheme serializes a UTF-16 CC-data-element by ordering octets in a way that either the less significant octet precedes or follows the more significant octet.

In the UTF-16 encoding scheme, the initial signature read as <FE FF> indicates that the more significant octet precedes the less significant octet, and <FF FE> the reverse. The signature is not part of the textual data.

In the absence of signature, the octet order of the UTF-16 encoding scheme is that the more significant octet precedes the less significant octet.

10.5 UTF-32BE

The UTF-32BE encoding scheme serializes a UTF-32 CC-data-element by ordering octets in a way that the more significant octets precede the less significant octets (also known as big-endian ordering).

In UTF-32BE, an initial octet sequence of <00 00 FE FF> is interpreted as FEFF ZERO WIDTH NO-BREAK SPACE and does not convey a signature meaning.

10.6 UTF-32LE

The UTF-32LE encoding scheme serializes a UTF-32 CC-data-element by ordering octets in a way that the less significant octets precede the more significant octets (also known as little-endian ordering).

In UTF-32LE, an initial octet sequence of <FF FE 00 00> is interpreted as FEFF ZERO WIDTH NO-BREAK SPACE and does not convey a signature meaning.

10.7 UTF-32

The UTF-32 encoding scheme serializes a UTF-32 code unit sequence by ordering octets in a way that either the less significant octets precede or follow the more significant octets.

In the absence of signature, the octet order of the UTF-32 encoding scheme is that the more significant octets precede the less significant octets.

11 Use of control functions with the UCS

This coded character set provides for use of control functions encoded according to ISO/IEC 6429 or similarly structured standards for control functions, and standards derived from these. A set or subset of such coded control functions may be used in conjunction with this coded character set. These standards encode a control function as a sequence of one or more octets.

When a control character of ISO/IEC 6429 is used with this coded character set, its coded representation as specified in ISO/IEC 6429 shall be padded to correspond with the number of octets in code unit of the adopted encoded form (see 9). Thus, the least significant octet shall be the bit combination specified in ISO/IEC 6429, and the more significant octet(s) shall be zeros.

For example, the control character FORM FEED is represented by "000C" in the UTF-16 encoding form, and "0000 000C" in the UTF-32 encoding form.

For escape sequences, control sequences, and control strings (see ISO/IEC 6429) consisting of a coded control character followed by additional bit combinations in the range 20 to 7F, each bit combination shall be padded by octet(s) with value 00.

For example, the escape sequence "ESC 02/00 04/00" is represented by "1B 20 40" in the UTF-8 encoding form, by "001B 0020 0040" in the UTF-16 encoding form, and "0000001B 00000020 00000040" in the UTF-32 encoding form.

NOTE 1 – The term "character" appears in the definition of many of the control functions specified in ISO/IEC 6429, to identify the elements on which the control functions will act. When such control functions are applied to coded characters according to ISO/IEC 10646 the action of those control functions will depend on the type of element from ISO/IEC 10646 that has been chosen, by the application, to be the element (or character) on which the control functions act. These elements may be chosen to be characters (non-combining characters and/or combining characters) or may be chosen in other ways (such as composite sequences) when applicable.

Code extension control functions for the ISO/IEC 2022 code extension techniques (such as designation escape sequences, single shift, and locking shift) shall not be used with this coded character set.

NOTE 2 – The following list provides the long names from ISO/IEC 6429 used in association with the control characters.

0000 NULL	0002 START OF TEXT
0001 START OF HEADING	0003 END OF TEXT

0004 END OF TRANSMISSION	0083 NO BREAK HERE
0005 ENQUIRY	0084 INDEX
0006 ACKNOWLEDGE	0085 NEXT LINE
0007 BELL	0086 START OF SELECTED AREA
0008 BACKSPACE	0087 END OF SELECTED AREA
0009 CHARACTER TABULATION	0088 CHARACTER TABULATION SET
000A LINE FEED	0089 CHARACTER TABULATION WITH JUSTIFICATION
000B LINE TABULATION	008A LINE TABULATION SET
000C FORM FEED	008B PARTIAL LINE FORWARD
000D CARRIAGE RETURN	008C PARTIAL LINE BACKWARD
000E SHIFT-OUT	008D REVERSE LINE FEED
000F SHIFT-IN	008E SINGLE-SHIFT TWO
0010 DATA LINK ESCAPE	008F SINGLE-SHIFT THREE
0011 DEVICE CONTROL ONE	0090 DEVICE CONTROL STRING
0012 DEVICE CONTROL TWO	0091 PRIVATE USE ONE
0013 DEVICE CONTROL THREE	0092 PRIVATE USE TWO
0014 DEVICE CONTROL FOUR	0093 SET TRANSMIT STATE

0016 SYNCHRONOUS IDLE	0095 MESSAGE WAITING
0017 END OF TRANSMISSION BLOCK	0096 START OF GUARDED AREA
0018 CANCEL	0097 END OF GUARDED AREA
0019 END OF MEDIUM	0098 START OF STRING
001A SUBSTITUTE	009A SINGLE CHARACTER INTRODUCER
001B ESCAPE	009B CONTROL SEQUENCE INTRODUCER
001C INFORMATION SEPARATOR FOUR	009C STRING TERMINATOR
001D INFORMATION SEPARATOR THREE	009D OPERATING SYSTEM COMMAND
001E INFORMATION SEPARATOR TWO	009E PRIVACY MESSAGE
001F INFORMATION SEPARATOR ONE	009F APPLICATION PROGRAM COMMAND
007F DELETE	
0082 BREAK PERMITTED HERE	

The control character 0084 INDEX has been removed from ISO/IEC 6492:1992. In addition, the control characters 000E and 000F are named SHIFT-OUT and SHIFT-IN respectively in 7-bit environment and LOCKING-SHIFT ONE and LOCKING-SHIFT ZERO respectively in 8-bit environment.

12 Declaration of identification of features

12.1 Purpose and context of identification

CC-data-elements conforming to ISO/IEC 10646 are intended to form all or part of a composite unit of coded information that is interchanged between an originator and a recipient. The identification of ISO/IEC 10646 (including the encoding form and the encoding scheme) and any subset of the coding space that have been adopted by the originator must also be available to the recipient. The route by which such identification is communicated to the recipient is outside the scope of ISO/IEC 10646.

However, some standards for interchange of coded information may permit, or require, that the coded representation of the identification applicable to the CC-data-element forms a part of the interchanged information. This clause specifies a coded representation for the identification of UCS and a subset of ISO/IEC 10646, and also of a C0 and a C1 set of control functions from ISO/IEC 6429 for use in conjunction with ISO/IEC 10646. Such coded representations provide all or part of an identification data element, which may be included in information interchange in accordance with the relevant standard.

In the context of these identifications, because the more significant octets shall precede the less significant octets when serialized, the only encoding schemes that can be selected are UTF-8, UTF-16BE, and UTF-32BE according to the relevant encoding forms (UTF-8, UTF-16, and UTF-32 respectively).

If two or more of the identifications are present, the order of those identifications shall follow the order as specified in this clause.

NOTE – An alternative method of identification is described in Annex N.

12.2 Identification of a UCS encoding form

When the escape sequences from ISO/IEC 2022 are used, the identification of a UCS encoding form (see 9) specified by ISO/IEC 10646 shall be by a designation sequence chosen from the following list:

ESC 02/05 02/15 04/09

UTF-8 encoding form; UTF-8 encoding scheme

ESC 02/05 02/15 04/12

UTF-16 encoding form; UTF-16BE encoding scheme

ESC 02/05 02/15 04/06

UTF-32 encoding form; UTF-32BE encoding scheme

NOTE 1 – The following designation sequences: ESC 02/05 02/15 04/00, ESC 02/05 02/15 04/01, ESC 02/05 02/15 04/03, ESC 02/05 02/15 04/04, 02/05 02/15 04/07, 02/05 02/15 04/08, 02/05 02/15 04/10, 02/05 02/15 04/011 used in previous versions of this standard to identify implementation levels 1 and 2 are deprecated. The remaining designation sequences correspond to the former level 3 which is now the only supported CC-data-element content definition.

NOTE 2 – The following escape sequence may also be used:

ESC 02/05 04/07

UTF-8 encoding form; UTF-8 encoding scheme

The escape sequence used for a return to the coding system of ISO/IEC 2022 is not padded (see 12.5).

If such an escape sequence appears within a CC-data-element conforming to ISO/IEC 2022, it shall consist only of the sequences of bit combinations as shown above.

If such an escape sequence appears within a CC-data-element conforming to ISO/IEC 10646, it shall be padded in accordance with clause 11.

12.3 Identification of subsets of graphic characters

When the control sequences of ISO/IEC 6429 are used, the identification of subsets (see 8) specified by ISO/IEC 10646 shall be by a control sequence IDENTIFY UNIVERSAL CHARACTER SUBSET (IUCS) as shown below.

CSI Ps... 02/00 06/13

Ps... means that there can be any number of selective parameters. The parameters are to be taken from the subset collection numbers as shown in Annex A of ISO/IEC 10646. When there is more than one parameter, each parameter value is separated by an octet with value 03/11.

Parameter values are represented by digits where octet values 03/00 to 03/09 represent digits 0 to 9.

If such an escape sequence appears within a CC-data-element conforming to ISO/IEC 2022, it shall consist only of the sequences of bit combinations as shown above.

If such a control sequence appears within a CC-data-element conforming to ISO/IEC 10646, it shall be padded in accordance with clause 11.

12.4 Identification of control function set

When the escape sequences from ISO/IEC 2022 are used, the identification of each set of control functions (see clause 11) of ISO/IEC 6429 to be used in conjunction with ISO/IEC 10646 shall be an identifier sequence of the type shown below.

ESC 02/01 04/00 identifies the full C0 set of ISO/IEC 6429

ESC 02/02 04/03 identifies the full C1 set of ISO/IEC 6429

For other C0 or C1 sets, the final octet F shall be obtained from the International Register of Coded Character Sets. The identifier sequences for these sets shall be

ESC 02/01 F identifies a C0 set

ESC 02/02 F identifies a C1 set

If such an escape sequence appears within a CC-data-element conforming to ISO/IEC 2022, it shall consist only of the sequences of bit combinations as shown above.

If such an escape sequence appears within a CC-data-element conforming to ISO/IEC 10646, it shall be padded in accordance with clause 11.

12.5 Identification of the coding system of ISO/IEC 2022

When the escape sequences from ISO/IEC 2022 are used, the identification of a return, or transfer, from UCS to the coding system of ISO/IEC 2022 shall be by the escape sequence ESC 02/05 04/00. If such an escape sequence appears within a CC-data-element conforming to ISO/IEC 10646, it shall be padded in accordance with clause 11.

If such an escape sequence appears within a CC-data-element conforming to ISO/IEC 2022, it shall consist only of the sequence of bit combinations as shown above.

NOTE – Escape sequence ESC 02/05 04/00 is normally used for return to the restored state of ISO/IEC 2022. The escape sequence ESC 02/05 04/00 specified here is sometimes not exactly as specified in ISO/IEC 2022 due to the presence of padding octets. For this reason the escape sequences in clause 12.2 for the identification of UCS include the octet 02/15 to indicate that the return does not always conform to that standard.

13 Structure of the code charts and lists

Clause 30 sets out the detailed code charts and the lists of character names for the graphic characters. It specifies graphic characters, their coded representation, and the character name for each character.

NOTE – Clause 30 also includes additional information on characters clarifying some feature of a character, such as its naming or usage, or its associated graphic symbol.

The graphic symbols are to be regarded as typical visual representations of the characters. ISO/IEC 10646 does not attempt to prescribe the exact shape of each character. The shape is affected by the design of the font employed, which is outside the scope of ISO/IEC 10646.

Graphic characters specified in ISO/IEC 10646 are uniquely identified by their names. This does not imply that the graphic symbols by which they are commonly imaged are always different. Examples of graphic characters with similar graphic symbols are LATIN CAPITAL LETTER A, GREEK CAPITAL LETTER ALPHA and CYRILLIC CAPITAL LETTER A.

The meaning attributed to any character is not specified by ISO/IEC 10646; it may differ from country to country, or from one application to another.

For the alphabetic scripts, the general principle has been to arrange the characters within any row in approximate alphabetic sequence; where the script has capital and small letters, these are arranged in pairs. However, this general principle has been overridden in some cases. For example, for those scripts for which a relevant standard exists, the characters are allocated according to that standard. This arrangement within the code charts will aid conversion between the existing standards and this coded character set. In general, however, it is anticipated that conversion between this coded character set and any other coded character set will use a table lookup technique.

It is not intended, nor will it often be the case, that the characters needed by any one user will be found all grouped together in one part of the code charts.

Furthermore, the user of any script will find that needed characters may have been coded elsewhere in this coded character set. This especially applies to the digits, to the symbols, and to the use of Latin letters in dual-script applications.

Therefore, in using this coded character set, the reader is advised to refer first to the block names list in Annex A.2 or an overview of the Planes in figures 5 to 9, and then to turn to the specific code chart for the relevant script and for symbols and digits. In addition, Annex G contains an alphabetically sorted list of character names.

14 Block and collection names

14.1 Block names

Named blocks of contiguous code points are specified within a plane for the purpose of allocation of characters sharing some common characteristic, such as script. The blocks specified within the BMP, SMP, SIP and SSP are listed in A.2, and are illustrated in figures 5 to 9.

Rules to be used for constructing the names of blocks are given in 24.4.1.

14.2 Collection names

Collections are shown in Annex A.

Rules to be used for constructing the names of collections are given in 24.4.2.

15 Mirrored characters in bidirectional context

15.1 Mirrored characters

A class of characters has special significance in the context of bidirectional text. The interpretation and rendering of any of these characters depend on the direction of the character being rendered that is in effect at the point in the CC-data-element where the coded representation of the character appears. The list of these characters is determined by having the 'Bidi_Mirrored' property set to 'Y' in the Unicode Standard (see reference to the Unicode Standard Bidi Mirrored property in 3).

NOTE 1 – Typically, a mirrored character has its image mirrored horizontally in text that is laid out from right to left. However, for some mathematical symbols, the 'mirrored' form is not an exact mirror image. See the Unicode Technical Report #25, "Unicode Support for Mathematics" for additional details.

This character mirroring is not limited to paired characters and shall be applied to all characters belonging to that class.

EXAMPLE

In a right-to-left text segment, the GREATER-THAN SIGN (rendered as ">" in left-to-right text) may be rendered as the "<" graphic symbol.

NOTE 2 – Many ancient scripts and some scripts in modern use can be written either right-to-left or left-to-right. It is often customary for one of these scripts to use the appropriately mirrored graphical symbol for any character represented by a graphic symbol that is not symmetric around the vertical axis. In such cases, it is up to the rendering system to display the graphic image appropriate for the writing direction employed. The directionality of the representative graphic symbol shown in the character code charts matches the default writing direction for the script. Characters belonging to these scripts have the "Bidi_Mirrored" property set to 'N' in the Unicode Standard (see reference to the Unicode Standard Bidi Mirrored property in 3).

Examples of such scripts include, but are not limited to, Old Italic, an ancient script for which the default writing direction in this standard is left-to-right, and Cypriot, an ancient script for which the default writing direction in this standard is right-to-left.

15.2 Directionality of bidirectional text

The Unicode Bidirectional Algorithm (see 3) describes the algorithm used to determine the directionality for bidirectional text.

16 Special characters

There are some characters that do not have printable graphic symbols or are otherwise special in some ways.

16.1 Space characters

The following characters are space characters. They represent all characters which have the General Category value set to 'Zs'.

Code Point	Name		
0020	SPACE	2005	FOUR-PER-EM SPACE
00A0	NO-BREAK SPACE	2006	SIX-PER-EM SPACE
1680	OGHAM SPACE MARK	2007	FIGURE SPACE
180E	MONGOLIAN VOWEL SEPARATOR	2008	PUNCTUATION SPACE
2000	EN QUAD	2009	THIN SPACE
2001	EM QUAD	200A	HAIR SPACE
2002	EN SPACE	202F	NARROW NO-BREAK SPACE
2003	EM SPACE	205F	MEDIUM MATHEMATICAL SPACE
2004	THREE-PER-EM SPACE	3000	IDEOGRAPHIC SPACE

NOTE 1 – The character 180E MONGOLIAN VOWEL SEPARATOR may be used between the MONGOLIAN LETTER A or the MONGOLIAN LETTER E at the end of a word and the preceding consonant letter. It indicates a special form of the graphic

symbol for the letter A or E and the preceding consonant. When rendered in visible form it is generally shown as a narrow space between the letters, but it may sometimes be shown as a distinct graphic symbol to assist the user.

NOTE 2 – The character 202F NARROW NO-BREAK-SPACE is a non-breaking space. It is similar to 00A0 NO-BREAK SPACE, except that it is rendered with a narrower width. When used with the Mongolian script this character is usually rendered at one-third of the width of a normal space, and it separates a suffix from the Mongolian word-stem. This allows for the normal rules of Mongolian character shaping to apply, while indicating that there is no word boundary at that position.

16.2 Currency symbols

Currency symbols in ISO/IEC 10646 do not necessarily identify the currency of a country. For example, YEN SIGN can be used for Japanese Yen and Chinese Yuan. Also, DOLLAR SIGN is used in numerous countries including the United States of America.

16.3 Format Characters

The following characters are format characters (see 6.3.3). They represent all characters which have the General Category value set to 'Cf', 'Zl', and 'Zp'. See Annex F.

<u>Code Point</u>	<u>Name</u>		
00AD	SOFT HYPHEN	2063	INVISIBLE SEPARATOR
0600	ARABIC NUMBER SIGN	2064	INVISIBLE PLUS
0601	ARABIC SIGN SANAH	206A	INHIBIT SYMMETRIC SWAPPING
0602	ARABIC FOOTNOTE MARKER	206B	ACTIVATE SYMMETRIC SWAPPING
0603	ARABIC SIGN SAFHA	206C	INHIBIT ARABIC FORM SHAPING
06DD	ARABIC END OF AYAH	206D	ACTIVATE ARABIC FORM SHAPING
070F	SYRIAC ABBREVIATION MARK	206E	NATIONAL DIGIT SHAPES
17B4	KHMER VOWEL INHERENT AQ	206F	NOMINAL DIGIT SHAPES
17B5	KHMER VOWEL INHERENT AA	2D7F	TIFINAGH CONSONANT JOINER
200B	ZERO WIDTH SPACE	FEFF	ZERO WIDTH NO-BREAK SPACE
200C	ZERO WIDTH NON-JOINER	FFF9	INTERLINEAR ANNOTATION ANCHOR
200D	ZERO WIDTH JOINER	FFFA	INTERLINEAR ANNOTATION SEPARATOR
200E	LEFT-TO-RIGHT MARK	FFFB	INTERLINEAR ANNOTATION TERMINATOR
200F	RIGHT-TO-LEFT MARK	110BD	KAITHI NUMBER SIGN
2028	LINE SEPARATOR	1D173	MUSICAL SYMBOL BEGIN BEAM
2029	PARAGRAPH SEPARATOR	1D174	MUSICAL SYMBOL END BEAM
202A	LEFT-TO-RIGHT EMBEDDING	1D175	MUSICAL SYMBOL BEGIN TIE
202B	RIGHT-TO-LEFT EMBEDDING	1D176	MUSICAL SYMBOL END TIE
202C	POP DIRECTIONAL FORMATTING	1D177	MUSICAL SYMBOL BEGIN SLUR
202D	LEFT-TO-RIGHT OVERRIDE	1D178	MUSICAL SYMBOL END SLUR
202E	RIGHT-TO-LEFT OVERRIDE	1D179	MUSICAL SYMBOL BEGIN PHRASE
2060	WORD JOINER	1D17A	MUSICAL SYMBOL END PHRASE
2061	FUNCTION APPLICATION	E0001	LANGUAGE TAG
2062	INVISIBLE TIMES	E0020-E007F	TAG SPACE to CANCEL TAG

16.4 Ideographic description characters

An Ideographic Description Character (IDC) is a graphic character, which is used with a sequence of other graphic characters to form an Ideographic Description Sequence (IDS). Such a sequence may be used to describe an ideographic character which is not specified with this International Standard. The Annex I describes them in more details. The list of IDC follows:

<u>Code Point</u>	<u>Name</u>
2FF0	IDEOGRAPHIC DESCRIPTION CHARACTER LEFT TO RIGHT
2FF1	IDEOGRAPHIC DESCRIPTION CHARACTER ABOVE TO BELOW
2FF2	IDEOGRAPHIC DESCRIPTION CHARACTER LEFT TO MIDDLE AND RIGHT
2FF3	IDEOGRAPHIC DESCRIPTION CHARACTER ABOVE TO MIDDLE AND BELOW
2FF4	IDEOGRAPHIC DESCRIPTION CHARACTER FULL SURROUND
2FF5	IDEOGRAPHIC DESCRIPTION CHARACTER SURROUND FROM ABOVE
2FF6	IDEOGRAPHIC DESCRIPTION CHARACTER SURROUND FROM BELOW
2FF7	IDEOGRAPHIC DESCRIPTION CHARACTER SURROUND FROM LEFT
2FF8	IDEOGRAPHIC DESCRIPTION CHARACTER SURROUND FROM UPPER LEFT
2FF9	IDEOGRAPHIC DESCRIPTION CHARACTER SURROUND FROM UPPER RIGHT
2FFA	IDEOGRAPHIC DESCRIPTION CHARACTER SURROUND FROM LOWER LEFT
2FFB	IDEOGRAPHIC DESCRIPTION CHARACTER OVERLAID

16.5 Variation selectors and variation sequences

Variation selectors are a specific class of combining characters immediately following a non decomposable base character and which indicate a specific variant form of graphic symbol for that character. A decomposable character is a character for which there exists an equivalent composite sequence. The character sequence consisting of a non decomposable base character followed by a variation selector is called a variation sequence.

NOTE 1 – Some variation selectors are specific to a script, such as the Mongolian free variation selectors, others are used with various other base characters such as the mathematical symbols.

Only the variation sequences defined or referenced in this clause indicate a specific variant form of graphic symbol; all other such sequences are undefined. Furthermore, variation selectors following other base characters and any non-base characters have no effect on the selection of the graphic symbol for that character.

No variation sequences using characters from VARIATION SELECTOR-2 to VARIATION SELECTOR-16 are defined at this time. Variations sequences composed of a unified ideograph as the base character and one of VARIATION SELECTOR-17 to VARIATION SELECTOR-256 from the Supplementary Special-purpose Plane (SSP) are registered in the Ideographic Variation Database defined by Unicode Technical Standard #37 (see 3).

NOTE 2 – This version of the standard incorporates by reference the variation sequences listed in version 2007-12-14 of the Ideographic Variation Database, as described at <http://www.unicode.org/ivd/data/2007-12-14/>.

The following list provides a description of the variant appearances corresponding to the use of appropriate variation selectors with all allowed base mathematical symbols.

NOTE 3 – The VARIATION SELECTOR-1 is the only variation selector used with mathematical symbols.

Sequence (UID notation)	Description of variant appearance
<2229, FE00>	INTERSECTION with serifs
<222A, FE00>	UNION with serifs
<2268, FE00>	LESS-THAN BUT NOT EQUAL TO with vertical stroke
<2269, FE00>	GREATER-THAN BUT NOT EQUAL TO with vertical stroke
<2272, FE00>	LESS-THAN OR EQUIVALENT TO following the slant of the lower leg
<2273, FE00>	GREATER-THAN OR EQUIVALENT TO following the slant of the lower leg
<228A, FE00>	SUBSET OF WITH NOT EQUAL TO with stroke through bottom members
<228B, FE00>	SUPERSET OF WITH NOT EQUAL TO with stroke through bottom members
<2293, FE00>	SQUARE CAP with serifs
<2294, FE00>	SQUARE CUP with serifs
<2295, FE00>	CIRCLED PLUS with white rim
<2297, FE00>	CIRCLED TIMES with white rim
<229C, FE00>	CIRCLED EQUALS equal sign touching the circle
<22DA, FE00>	LESS-THAN EQUAL TO OR GREATER-THAN with slanted equal
<22DB, FE00>	GREATER-THAN EQUAL TO OR LESS-THAN with slanted equal
<2A3C, FE00>	INTERIOR PRODUCT tall variant with narrow foot
<2A3D, FE00>	RIGHTHAND INTERIOR PRODUCT tall variant with narrow foot
<2A9D, FE00>	SIMILAR OR LESS-THAN with similar following the slant of the upper leg
<2A9E, FE00>	SIMILAR OR GREATER-THAN with similar following the slant of the upper leg
<2AAC, FE00>	SMALLER THAN OR EQUAL TO with slanted equal
<2AAD, FE00>	LARGER THAN OR EQUAL TO with slanted equal
<2ACB, FE00>	SUBSET OF ABOVE NOT EQUAL TO with stroke through bottom members
<2ACC, FE00>	SUPERSET OF ABOVE NOT EQUAL TO with stroke through bottom members

The following list provides a description of the variant appearances corresponding to the use of appropriate variation selectors with all allowed base Mongolian characters. Only some presentation forms of the base Mongolian characters used with the Mongolian free variation selectors produce variant appearances.

NOTE 4 – The Mongolian characters have various presentation forms depending on their position in a CC-data element. These presentations forms are called isolate, initial, medial and final.

<u>Sequence (UID notation)</u>	<u>position</u>	<u>Description of variant appearance</u>
<1820, 180B>	isolate, medial, final	MONGOLIAN LETTER A second form
<1820, 180C>	medial	MONGOLIAN LETTER A third form
<1821, 180B>	initial, final	MONGOLIAN LETTER E second form
<1822, 180B>	medial	MONGOLIAN LETTER I second form
<1823, 180B>	medial,final	MONGOLIAN LETTER O second form
<1824, 180B>	medial	MONGOLIAN LETTER U second form
<1825, 180B>	medial,final	MONGOLIAN LETTER OE second form
<1825, 180C>	medial	MONGOLIAN LETTER OE third form
<1826, 180B>	isolate, medial, final	MONGOLIAN LETTER UE second form
<1826, 180C>	medial	MONGOLIAN LETTER UE third form
<1828, 180B>	initial, medial	MONGOLIAN LETTER NA second form
<1828, 180C>	medial	MONGOLIAN LETTER NA third form
<1828, 180D>	medial	MONGOLIAN LETTER NA separate form
<182A, 180B>	final	MONGOLIAN LETTER BA alternative form
<182C, 180B>	initial, medial	MONGOLIAN LETTER QA second form
<182C, 180B>	isolate	MONGOLIAN LETTER QA feminine second form
<182C, 180C>	medial	MONGOLIAN LETTER QA third form
<182C, 180D>	medial	MONGOLIAN LETTER QA fourth form
<182D, 180B>	initial, medial	MONGOLIAN LETTER GA second form
<182D, 180B>	final	MONGOLIAN LETTER GA feminine form
<182D, 180C>	medial	MONGOLIAN LETTER GA third form
<182D, 180D>	medial	MONGOLIAN LETTER GA feminine form
<1830, 180B>	final	MONGOLIAN LETTER SA second form
<1830, 180C>	final	MONGOLIAN LETTER SA third form
<1832, 180B>	medial	MONGOLIAN LETTER TA second form
<1833, 180B>	initial, medial, final	MONGOLIAN LETTER DA second form
<1835, 180B>	final	MONGOLIAN LETTER JA second form
<1836, 180B>	initial, medial	MONGOLIAN LETTER YA second form
<1836, 180C>	medial	MONGOLIAN LETTER YA third form
<1838, 180B>	final	MONGOLIAN LETTER WA second form
<1844, 180B>	medial	MONGOLIAN LETTER TODO E second form
<1845, 180B>	medial	MONGOLIAN LETTER TODO I second form
<1846, 180B>	medial	MONGOLIAN LETTER TODO O second form
<1847, 180B>	isolate, medial, final	MONGOLIAN LETTER TODO U second form
<1847, 180C>	medial	MONGOLIAN LETTER TODO U third form
<1848, 180B>	medial	MONGOLIAN LETTER TODO OE second form
<1849, 180B>	isolate, medial	MONGOLIAN LETTER TODO UE second form
<184D, 180B>	initial, medial	MONGOLIAN LETTER TODO QA feminine form
<184E, 180B>	medial	MONGOLIAN LETTER TODO GA second form
<185D, 180B>	medial, final	MONGOLIAN LETTER SIBE E second form
<185E, 180B>	medial, final	MONGOLIAN LETTER SIBE I second form

<185E, 180C> medial, final	MONGOLIAN LETTER SIBE I third form
<1860, 180B> medial, final	MONGOLIAN LETTER SIBE UE second form
<1863, 180B> medial	MONGOLIAN LETTER SIBE KA second form
<1868, 180B> initial, medial	MONGOLIAN LETTER SIBE TA second form
<1868, 180C> medial	MONGOLIAN LETTER SIBE TA third form
<1869, 180B> initial, medial	MONGOLIAN LETTER SIBE DA second form
<186F, 180B> initial, medial	MONGOLIAN LETTER SIBE ZA second form
<1873, 180B> medial, final	MONGOLIAN LETTER MANCHU I second form
<1873, 180C> medial, final	MONGOLIAN LETTER MANCHU I third form
<1873, 180D> medial	MONGOLIAN LETTER MANCHU I fourth form
<1874, 180B> medial	MONGOLIAN LETTER MANCHU KA second form
<1874, 180B> final	MONGOLIAN LETTER MANCHU KA feminine first form
<1874, 180C> medial	MONGOLIAN LETTER MANCHU KA feminine first form
<1874, 180C> final	MONGOLIAN LETTER MANCHU KA feminine second form
<1874, 180D> medial	MONGOLIAN LETTER MANCHU KA feminine second form
<1876, 180B> initial, medial	MONGOLIAN LETTER MANCHU FA second form
<1880, 180B> all	MONGOLIAN LETTER ALI GALI ANUSVARA ONE second form
<1881, 180B> all	MONGOLIAN LETTER ALI GALI VISARGA ONE second form
<1887, 180B> isolate, final	MONGOLIAN LETTER ALI GALI A second form
<1887, 180C> final	MONGOLIAN LETTER ALI GALI A third form
<1887, 180D> final	MONGOLIAN LETTER ALI GALI A fourth form
<1888, 180B> final	MONGOLIAN LETTER ALI GALI I second form
<188A, 180B> initial, medial	MONGOLIAN LETTER ALI GALI NGA second form

The following list provides a description of the variant appearances corresponding to the use of appropriate variation selectors with all allowed base Phags-pa characters. These variation selector sequences do not select fixed visual representation; rather, they select a representation that is reversed from the normal form predicted by the preceding character.

Sequence (UID notation)	Description of variant appearance
<A856, FE00>	PHAGS-PA LETTER reversed shaping SMALL A
<A85C, FE00>	PHAGS-PA LETTER reversed shaping HA
<A85E, FE00>	PHAGS-PA LETTER reversed shaping I
<A85F, FE00>	PHAGS-PA LETTER reversed shaping U
<A860, FE00>	PHAGS-PA LETTER reversed shaping E
<A868, FE00>	PHAGS-PA LETTER reversed shaping SUBJOINED YA

NOTE 5 – The variation selector only selects a specific *appearance* among those acceptable for an already encoded character. It is not intended as a general code extension mechanism.

NOTE 6 – The exhaustive list of defined variation sequences other than ideographic variation sequences is also described as *StandardizedVariants.html* in the Unicode character database (<http://www.unicode.org/Public/UNIDATA/StandardizedVariants.html>)

17 Presentation forms of characters

Each presentation form of a character provides an alternative form, for use in a particular context, to the nominal form of the character or sequence of characters from the other zones of graphic characters. The transformation from the nominal form to the presentation forms may involve substitution, superimposition, or combination.

The rules for the superimposition, choice of differently shaped characters, or combination into ligatures, or conjuncts, which are often of extreme complexity, are not specified in ISO/IEC 10646.

In general, presentation forms are not intended to be used as a substitute for the nominal forms of the graphic characters specified elsewhere within this coded character set. However, specific applications may encode these presentation forms instead of the nominal forms for specific reasons among which is compatibility with existing devices. The rules for searching, sorting, and other processing operations on presentation forms are outside the scope of ISO/IEC 10646.

Within the BMP these characters are mostly allocated to code points within rows from FB to FF.

18 Compatibility characters

Compatibility characters are included in ISO/IEC 10646 primarily for compatibility with existing coded character sets to allow two-way code conversion without loss of information.

Within the BMP many of these characters are allocated to code points within rows F9, FA, FE, and FF, and within rows 31 and 33. Some compatibility characters are also allocated within other rows.

NOTE 1 – There are twelve code points in the row FA of the BMP which are allocated to CJK Unified Ideographs.

Within the Supplementary Ideographic Plane (SIP) these characters are allocated to code points within rows F8 to FA.

The CJK compatibility ideographs are ideographs that should have been unified with one of the CJK unified ideographs, per the unification rule described in Annex S. However, they are included in this International Standard as separate characters, because, based on various national, cultural, or historical reasons for some specific country and region, some national and regional standards assign separate code points for them.

NOTE 2 – For this reason, compatibility ideographs should only be used for maintaining and guaranteeing a round trip conversion with the specific national, regional, or other standard. Other usage is strongly discouraged.

19 Order of characters

Usually, coded characters appear in a CC-data-element in logical order (logical or backing store order corresponds approximately to the order in which characters are entered from the keyboard, after corrections such as insertions, deletions, and overtyping have taken place). This applies even when characters of different dominant direction are mixed: left-to-right (Greek, Latin, Thai) with right-to-left (Arabic, Hebrew), or with vertical (Mongolian) script.

Some characters may not appear linearly in final rendered text. For example, the medial form of DEVANAGARI VOWEL SIGN I is displayed before the character that it logically follows in the CC-data-element.

20 Combining characters

This clause specifies the use of combining characters (see 4.14).

20.1 Order of combining characters

Coded representations of combining characters shall follow that of the graphic character with which they are associated (for example, coded representations of LATIN SMALL LETTER A followed by COMBINING TILDE represent a composite sequence for Latin “ã”).

If a combining character is to be regarded as a composite sequence in its own right, it shall be coded as a composite sequence by association with the character 00A0 NO-BREAK SPACE. For example, grave accent can be composed as 00A0 NO-BREAK SPACE followed by 0300 COMBINING GRAVE ACCENT.

NOTE – Indic combining marks for vowels form a special category of combining characters, since the presentation can depend on more than one of the surrounding characters. Thus it might not be desirable to associate these Indic combining marks with the character NO-BREAK SPACE.

20.2 Combining class and canonical ordering

Each combining character has a combining class value determined by the Unicode Standard (see reference to the Unicode Standard Combining classes in 3). The combining class is used to determine the canonical ordering which is part of the normalization process (see 21). Canonical ordering consists in ordering combining characters in the increasing order of their combining class. Combining characters with a combining class value of zero are not re-ordered relative to other characters.

20.3 Appearance in code charts

Combining characters intended to be positioned relative to the associated character are depicted within the character code charts above, below, to the right of, to the left of, in, around, or through a dotted circle to show their position relative to the base character. In presentation, these characters are intended to be positioned relative to the preceding base character in some manner, and not to stand alone or function as base characters. This is the motivation for the term “combining”.

NOTE – Diacritics are the principal class of combining characters used in European alphabets. For many other scripts used in India and South East Asia, combining characters encode vowel letters; as such they are not generally referred to as “diacritical marks”.

20.4 Alternate coded representations

Alternate coded representations of text are generated by using multiple combining characters in different orders, or using various equivalent combinations of characters and composite sequences. These alternate coded representations result in multiple representations of the same text. Normalizing (see 21) these coded representations reduces significantly, but does not eliminate, the occurrences of these multiple representations.

NOTE – For example, the French word “là” may be represented by the characters LATIN SMALL LETTER L followed by LATIN SMALL LETTER A WITH GRAVE, or may be represented by the characters LATIN SMALL LETTER L followed by LATIN SMALL LETTER A followed by COMBINING GRAVE ACCENT. When the normalization forms are applied on those alternate coded representations, only one representation remains. The form of the remaining representation depends on the normalization form used.

20.5 Multiple combining characters

There are instances where more than one combining character is applied to a single graphic character. ISO/IEC 10646 does not restrict the number of combining characters that can follow a base character. The following rules apply to the presentation of these characters:

- a) If the combining characters can interact in presentation (for example, COMBINING MACRON and COMBINING DIAERESIS), then the position of the combining characters in the resulting graphic display is determined by the order of the coded representation of the combining characters. The presentations of combining characters are to be positioned from the base character outward. For example, combining characters placed above a base character are stacked vertically, starting with the first encountered in the sequence of coded representations and continuing for as many marks above as are required by the coded combining characters following the coded base character. For combining characters placed below a base character, the situation is inverted, with the combining characters starting from the base character and stacking downward.

An example of multiple combining characters above the base character is found in Thai, where a consonant letter can have above it one of the vowels 0E34 to 0E37 and, above that, one of four tone marks 0E48 to 0E4B. The order of the coded representation is: base consonant, followed by a vowel, followed by a tone mark.

- b) Some specific combining characters override the default stacking behaviour by being positioned horizontally rather than stacking, or by forming a ligature with an adjacent combining character. When positioned horizontally, the order of coded representations is reflected by positioning in the dominant order of the script with which they are used. For example, horizontal accents in a left-to-right script are coded left-to-right.

Prominent characters that show such override behaviour are associated with specific scripts or alphabets. For example, the COMBINING GREEK KORONIS (0343) requires that, together with a following acute or grave accent, they be rendered side-by-side above a letter, rather than the accent marks be-

ing stacked above the COMBINING GREEK KORONIS. The order of the coded representations is: the letter itself, followed by that of the breathing mark, followed by that of the accent marks. Two Vietnamese tone marks, which have the same graphic appearance as the Latin acute and grave accent marks, do not stack above the three Vietnamese vowel letters which already contain the circumflex diacritic (â, ê, ô). Instead, they form ligatures with the circumflex component of the vowel letters.

- c) If the combining characters do not interact in presentation (for example, when one combining character is above a graphic character and another is below), the resultant graphic symbol from the base character and combining characters in different orders may appear the same. For example, the coded representations of LATIN SMALL LETTER A, followed by COMBINING CARON, followed by COMBINING OGONEK may result in the same graphic symbol as the coded representations of LATIN SMALL LETTER A, followed by COMBINING OGONEK, followed by COMBINING CARON.

Combining characters in Hebrew or Arabic scripts do not normally interact. Therefore, the sequence of their coded representations in a composite sequence does not affect its graphic symbol. The rules for forming the combined graphic symbol are beyond the scope of ISO/IEC 10646.

20.6 Collections containing combining characters

In some collections of characters listed in Annex A, such as collections 14 (BASIC ARABIC) or 25 (THAI), both combining characters and non-combining characters are included.

Other collections of characters listed in Annex A comprise only combining characters, for example collection 7 (COMBINING DIACRITICAL MARKS).

20.7 Combining Grapheme Joiner

The character 034F COMBINING GRAPHEME JOINER is used to indicate that adjacent characters are to be treated as a unit for the purpose of language-sensitive collation and searching. In language-sensitive collation and searching, the combining grapheme joiner should be ignored unless it specifically occurs with a tailored collation element mapping. For rendering, the combining grapheme joiner is invisible.

NOTE – The combining grapheme joiner may be used to differentiate two usages of a combining character by using it for one of the two cases. For example, where a distinction is needed between the German umlaut and the tréma, the COMBINING GRAPHEME JOINER (034F) followed by the COMBINING DIAERESIS (0308) should be used to represent the tréma while the COMBINING DIAERESIS (0308) alone should be used to represent the German umlaut.

21 Normalization forms

Normalization forms are the mechanisms allowing the selection of a unique coded representation among alternative; but equivalent coded text representations of the same text. Normalization forms for use with ISO/IEC 10646 are specified in the Unicode Standard UAX#15 (see 3). There are four normalization forms:

- 1) Normalization Form D (NFD),
- 2) Normalization Form C (NFC),
- 3) Normalization Form KD (NFKD),
- 4) Normalization Form KC (NFKC).

NOTE 1 – The result of applying any of these normalization forms onto a CC-data-element is intended to stay stable over time. It means that the normalized representation of a CC-data-element consisting of characters assigned in this version of the standard remains normalized even when the standard is amended.

NOTE 2 – Some normalization forms favour composite sequences over shorter representations of text, others favour the shorter representations. The backward compatibility requirement is provided by establishing ISO/IEC 10646-1:2000 (2nd Edition) and ISO/IEC 10646-2:2001 (1st Edition) as the reference versions for the definition of the shorter representation of text. The union of their repertoire is identical to the fixed collection UNICODE 3.2 (see A.6.2).

NOTE 3 – The goal of normalization is to provide a unique normalized result for any given CC-data element to facilitate, among other things, identity matching. A normalized form does not necessarily represent the optimal sequence from a linguistic point of view.

22 Special features of individual scripts and symbol repertoires

22.1 Hangul syllable composition method

In rendering, a sequence of Hangul Jamo (from HANGUL JAMO block: 1100 to 11FF) is displayed as a series of syllable blocks. Jamo can be classified into three classes: Choseong (syllable-initial characters or initial consonants), Jungseong (syllable-peak characters or medial vowels), and Jongseong (syllable-final characters or final consonants). A complete syllable block is composed of a Choseong and a Jungseong, and optionally a Jongseong.

An incomplete syllable is a string of one or more characters which does not constitute a complete syllable (for example, a Choseong alone, a Jungseong alone, a Jongseong alone, or a Jungseong followed by a Jongseong). An incomplete syllable which starts with a Jungseong shall be preceded by a CHOSEONG FILLER (115F). An incomplete syllable composed of a Jongseong alone shall be preceded by a CHOSEONG FILLER (115F) and JUNGSEONG FILLER (1160). An incomplete syllable composed of a Choseong alone shall be followed by a JUNGSEONG FILLER (1160).

NOTE 1 – Hangul Jamo are not combining characters.

NOTE 2 – When a combining character such as HANGUL SINGLE DOT TONE MARK (302E) is intended to apply to a sequence of Hangul Jamo it should be placed at the end of the sequence, after the Hangul Jamo character which completes the syllable block.

NOTE 3 – Hangul text can be represented in several different ways in this standard. Korean Standard KS X 1026-1: Information Technology - Universal Multiple-Octet Coded Character set (UCS) - Hangul - Part 1, Hangul processing guide for information interchange, provides guidelines on how to ensure interoperability in information interchange.

22.2 Features of scripts used in India and some other South Asian countries

In the code charts for Rows 09 to 0D and 0F, and for the MYANMAR block in Row 10, of the BMP (see 30) the graphic symbols shown for some characters appear to be formed as compounds of the graphic symbols for two other characters in the same table.

EXAMPLE 1 Row 09 Devanagari

The graphic symbol for 0906 DEVANAGARI LETTER AA appears as if it is constructed from the graphic symbols for 0905 DEVANAGARI LETTER A and 093E DEVANAGARI VOWEL SIGN AA

EXAMPLE 2 Row 0D Malayalam

The graphic symbol for 0D08 MALAYALAM LETTER II appears as if it is constructed from the graphic symbols for 0D07 MALAYALAM LETTER I and 0D57 MALAYALAM AU LENGTH MARK

In such cases a single coded character may appear to the user to be equivalent to the sequence of two coded characters whose graphic symbols, when combined, are visually similar to the graphic symbol of that single character, as in a composite sequence (see 4.17).

A “unique-spelling” rule is defined as follows. According to this rule, no coded character from a table for Rows 09 to 0D or 0F, or for the MYANMAR block in Row 10, with the list of exceptions mentioned below, shall be regarded as equivalent to a sequence of two or more other coded characters taken from the same table.

- Two-part dependent vowel signs,
- Independent vowel 1025 MYANMAR LETTER UU,
- Consonants including a nukta sign.

NOTE – All these characters have canonical mapping consisting of a sequence of two characters.

22.3 Byzantine musical symbols

The Byzantine Musical Notation System makes use of the so-called ‘three-stripe’ effect. There are signs that appear in the Upper, Middle or Lower stripes. Other signs are known as musical characters and appear in the textual part of the notation system. Multiple signs can be stacked together in their appropriate stripe.

22.4 Source references for pictographic symbols

Some symbols are associated by reference with various industrial sources. Unlike CJK Unified ideographs, these references do not establish character identity. These sources may be associated with either single code points or sequences of code points.

The symbol sources are:

- DoCoMo Shift-JIS code
- KDDI Shift-JIS code
- SoftBank Shift-JIS code

The content linked to is a plain text file, using ISO/IEC 646-IRV characters with LINE FEED as end of line mark, that specifies, after a 7-lines header, source reference lines; each line containing the following information organized in fields delimited by ‘;’:

- 1st field: UCS code point or sequence (hhhh | hhhhh) (<space> (hhhh | hhhhh)) *
- 2nd field: DoCoMo Shift-Jis code (hhhh)
- 3rd field: KDDI Shift-Jis code (hhhh)
- 4th field: SoftBank Shift-JIS code (hhhh)

The format definition uses ‘h’ as a decimal unit and <space> as the SPACE character.

[Click on this highlighted text to access the reference file.](#)

NOTE – The content is also available as a separate viewable file in the same file directory as this document. The file is named “EmojiSrc.txt”.

23 Source references for CJK Ideographs

23.1 List of source references

A CJK Ideograph is always referenced by at least one source reference. These source references are provided in a machine-readable format that is accessible as links to this document. The content pointed by these links is also normative.

NOTE 1 – The referenced files are only available to users who obtain their copy of the standard in a machine-readable format. However, the file format makes them printable.

The source reference information establishes the character identity for CJK Ideographs. A source reference is established by associating a CJK Ideograph code point with one or several values in the source standards listed in 0 and 23.4. Such a source standard originates from the following categories:

- Hanzi G sources,
- Hanzi H sources,
- Hanzi M sources,
- Hanzi T sources,
- Kanji J sources,
- Hanja K sources,
- Hanja KP sources,
- ChuNom V sources, and
- Unicode U sources

For a given code point, only one source reference can be created for each of the source standard category (G, H, M, T, J, K, KP, V, and U). In order to provide a comprehensive coverage for a source standard

category, when a source standard is referenced, all its unique associations with existing CJK Ideographs are documented.

The following list identifies all sources referenced by the CJK Ideographs in both the BMP and the SIP.

The Hanzi G sources are

G0	GB2312-80
G1	GB12345-90 with 58 Hong Kong and 92 Korean “Idu” characters
G3	GB7589-87 unsimplified forms
G5	GB7590-87 unsimplified forms
G7	General Purpose Hanzi List for Modern Chinese Language, and General List of Simplified Hanzi
GS	Singapore Characters
G8	GB8565-88
G9	GB18030-2000
GE	GB16500-95
G_4K	Siku Quanshu (四庫全書)
G_BK	Chinese Encyclopedia (中國大百科全書)
G_CH	Ci Hai (辭海)
G_CY	Ci Yuan (辭源)
G_CYY	Chinese Academy of Surveying and Mapping Ideographs (中国测绘科学院用字)
G_FZ	Founder Press System (方正排版系统)
G_GFHZB	ZhongHua ZiHai (中华字海), XianDai HanYu CiDian (现代汉语词典), or Ci-Hai (辞海)
G_GH	Gudai Hanyu Cidian (古代汉语词典)
G_GJZ	Commercial Press Ideographs (商务印书馆用字)
G_HC	Hanyu Dacidian (漢語大詞典)
G_HZ	Hanyu Dazidian ideographs (漢語大字典)
G_IDC	ID system of the Ministry of Public Security of China, 2009
G_KX	Kangxi Dictionary ideographs (康熙字典) 9 th edition (1958) including the addendum (康熙字典) 補遺
G_XC	Xiandai Hanyu Cidian (现代汉语词典)
G_ZFY	Hanyu Fangyan Dacidian (汉语方言大辞典)
G_ZJW	Yin Zhou Jin Wen Jicheng Yin De (殷周金文集成引得)

The Hanzi H source is

H	Hong Kong Supplementary Character Set – 2004
---	--

The Hanzi M source is

MAC	Macao Information System Character Set (澳門資訊系統字集)
-----	---

The Hanzi T sources are

T1	TCA-CNS 11643-1992 1st plane
T2	TCA-CNS 11643-1992 2nd plane
T3	TCA-CNS 11643-1992 3rd plane with some additional characters
T4	TCA-CNS 11643-1992 4th plane
T5	TCA-CNS 11643-1992 5th plane
T6	TCA-CNS 11643-1992 6th plane
T7	TCA-CNS 11643-1992 7th plane
TB	TCA-CNS Ministry of Education, Hakka dialect, May 2007
TC	TCA-CNS 11643-1992 12th plane
TD	TCA-CNS 11643-1992 13th plane
TE	TCA-CNS 11643-1992 14th plane
TF	TCA-CNS 11643-1992 15th plane

The Kanji J sources are

J0	JIS X 0208-1990
J1	JIS X 0212-1990
J3	JIS X 0213:2000 level-3
J3A	JIS X 0213:2004 level-3
J4	JIS X 0213:2000 level-4
JA	Unified Japanese IT Vendors Contemporary Ideographs, 1993
JH	Hanyo-Denshi Program (汎用電子情報交換環境整備プログラム), 2009
JK	Japanese KOKUJI Collection
J_ARIB	Association of Radio Industries and Businesses (ARIB) ARIB STD-B24 Version 5.1, March 14 2007

The Hanja K sources are

K0	KS X 1001:2004 (formerly KS C 5601-1987)
K1	KS X 1002:2001 (formerly KS C 5657-1991)
K2	PKS C 5700-1 1994
K3	PKS C 5700-2 1994
K4	PKS 5700-3:1998
K5	Korean IRG Hanja Character Set 5th Edition: 2001

NOTE 2 – The content of the repertoire covered by the K2, K3, K4, and K5 sources is in the process of being reedited in new Korean standards.

The Hanja KP sources are

KP0	KPS 9566-97
KP1	KPS 10721:2000 and KPS 10721:2003

The ChuNom V sources are

V0	TCVN 5773:1993
V1	TCVN 6056:1995
V2	VHN 01:1998
V3	VHN 02: 1998
V4	Dictionary on Nom 2006, Dictionary on Nom of Tay ethnic 2006, Lookup Table for Nom in the South 1994

The Unicode U source is

UTC	The Unicode Technical Report #45, U-source Ideographs, June 2008
-----	--

NOTE 3 – Even if source references get updated, the source reference information is not updated. The updated source references may only identify characters not previously covered by the older version.

23.2 Source references for CJK Unified Ideographs

The procedures that were used to derive the unified ideographs from the source character set standards, and the rules for their arrangement in the code charts in 30, are described in Annex S.

NOTE 1 – The source separation rule described by the clause S.1.6 of that annex only apply to CJK Unified Ideographs within the BMP.

The content linked to is a plain text file, using ISO/IEC 646-IRV characters with LINE FEED as end of line mark, that specifies, after a 13-lines header, as many lines as CJK Unified Ideographs in the sum of the two planes; each containing the following information organized in fields delimited by ‘;’ (empty fields use no character):

- 1st field: BMP or SIP code point (0hhhh) , (2hhhh)
- 2nd field: Radical Stroke index (d{ 1 , 3 } ‘ . d{ 1 , 2 }), (Radical is one to three digits, optionally followed by an apostrophe for alternate radical, followed by a full stop, and ending by one or two digits for the stroke count).

- 3rd field: Hanzi G sources (G0-hhhh), (G1-hhhh), (G3-hhhh), (G5-hhhh), (G7-hhhh), (GS-hhhh), (G8-hhhh), (G9-hhhh), (GE-hhhh), (G4K), (GBK), (GBKdddd), (GCH), (GCHdddd), (GCY), (GCYYdddd), (GFHZBddd), (GFZ), (GFZdddd), (GHdddd), (GHC), (GHCdddd), (GHZ), (GHZdddd), (GIDCddd), (GJZdddd), (GKXdddd.dd), (GXCdddd), (GZFYdddd), or (GZJWdddd)
- 4th field: Hanzi T sources (T1-hhhh), (T2-hhhh), (T3-hhhh), (T4-hhhh), (T5-hhhh), (T6-hhhh), (T7-hhhh), (TB-hhhh), (TC-hhhh), (TD-hhhh), (TE-hhhh), or (TF-hhhh)
- 5th field: Kanji J sources (J0-hhhh), (J1-hhhh), (J3-hhhh), (J3A-hhhh), (J4-hhhh), (JA-hhhh), (JH-xxxxxx), (JK-ddddd), or (JARIB-hhhh)
- 6th field: Hanja K sources (K0-hhhh), (K1-hhhh), (K2-hhhh), (K3-hhhh), (K4-hhhh), or (K5-hhhh)
- 7th field: ChuNom V sources (V0-hhhh), (V1-hhhh), (V2-hhhh), (V3-hhhh), or (V4-hhhh)
- 8th field: Hanzi H source (H-hhhh)
- 9th field: Hanja KP sources (KP0-hhhh) or (KP1-hhhh)
- 10th field: Unicode U source (UTCdddd)
- 11th field: Hanzi M source (MACdddd)

The format definition uses 'd' as a decimal unit, 'h' as a hexadecimal unit, and 'x' as an alphanumerical unit (0 to 9 and A to Z). Uppercase characters, digits and all other symbols between parentheses appear as shown.

NOTE 3 – Concerning JIS X 0213:2000 and 2004 sources, level-4 references correspond to the second plane; other level references correspond to the first plane.

NOTE 4 – The original source references in the Hanja K4 source (PKS 5700-3:1998) are described using a single decimal index without section or position values. For better consistency with the other sources, those indexes have been converted into hexadecimal values in the source reference file. Unlike the other hexadecimal values, they do not decompose in section, position values.

[Click on this highlighted text to access the reference file.](#)

NOTE 5 – The content is also available as a separate viewable file in the same file directory as this document. The file is named: "CJKU_SR.txt".

23.3 Source reference presentation for CJK Unified Ideographs

Unlike other character repertoires which only show one graphic symbol per character, the code charts for CJK Unified Ideographs show one graphic symbol per source reference with additional information related to their identity such as radical, stroke count, and numeric value of the various source references.

The graphic representation for the radical is shown immediately below the code point, along with the radical number and the stroke count. That stroke count does not include the radical itself.

The code chart for the CJK UNIFIED IDEOGRAPHS block (4E00-9FFF) uses a fixed column format (i.e. source references from a given source always appear in the same column) while the code charts for the other CJK Unified blocks show graphic symbols per the following order of appearance: G, T, J, K, KP, V, H, M, and U.

23.3.1 Source reference presentation for CJK UNIFIED IDEOGRAPHS block

The following figure shows the presentation for the CJK UNIFIED IDEOGRAPH block. Graphic representations for the Hanzi G and T sources, the Kanji J source, the Hanja K source, the Hanja KP source, and the ChuNom V source are shown in that order when present. If sources from another of the two Hanzi sources (H or M sources) also exist, they are shown in a new row in the same Hanzi column. U sources are shown in the same column as J sources but in a new row.

The following figure shows an example for characters 4E00-4E09 and 4E12-4E1A.

HEX	C	J	K	V	HEX	C	J	K	V
4E00	一	一	一	一	4E12	刃	刃	刃	
— 1.0	G0-523B T1-4421	J0-306C	K0-6C69	V1-4A21	— 1.3	GE-2123 T4-2139	J1-3025

Figure 4 – Source reference presentation for CJK UNIFIED IDEOGRAPHS EXTENSION B, C, and D

23.4 Source references for CJK Compatibility Ideographs

The content linked to is a plain text file, using ISO/IEC 646-IRV characters with LINE FEED as end of line mark, that specifies, after a 11-lines header, as many lines as CJK Compatibility Ideographs; each containing the following information organized in fields delimited by ‘;’ (empty fields use no character):

- 1st field: BMP or SIP code point (0hhhh) or (2hhhh)
- 2nd field: Code point of corresponding CJK Unified Ideograph (0hhhh) or (2hhhh)
- 3rd field: Hanzi T sources (T3-hhhh) , (T4-hhhh) , (T5-hhhh) , (T6-hhhh) , (T7-hhhh) , or (TF-hhhh)
- 4th field: Hanzi H source (H-hhhh)
- 5th field: Kanji J sources (J3-hhhh) , (J4-hhhh) , or (JARIB-hhhh)
- 6th field: Hanja K source (K0-hhhh)
- 7th field: Unicode U source (UTCdddd)
- 8th field: Hanja KP source (KP1-hhhh)

The format definition uses ‘h’ as a hexadecimal unit. Uppercase characters, digits and all other symbols between parentheses appear as shown.

NOTE 1 – Concerning JIS X 0213:2000 and 2004 sources, level-4 references correspond to the second plane; other level references correspond to the first plane.

[Click on this highlighted text to access the reference file.](#)

NOTE 2 – The content is also available as a separate viewable file in the same file directory as this document. The file is named: “CJKC_SR.txt”.

24 Character names and annotations

24.1 Entity names

This standard specifies names for the following entity types

- Characters, as character names and character name aliases
- named UCS sequences identifiers (see 25)
- blocks (see 14 and A.2)
- collections (see A.1)

The names given by this standard to these entities shall follow the rules for name formation and name uniqueness specified in this clause. This specification applies to the entity names in the English language version of this standard.

NOTE 1 – In a version of such a standard in another language a) these rules may be amended to permit names to be generated using words and syntax that are considered appropriate within that language; b) the entity names from this version of the standard may be replaced by equivalent unique names constructed according to the rules amended as in a) above.

NOTE 2 – Additional guidelines for constructing entity names are given in Annex L for information.

24.2 Name formation

An entity names shall consist only of the following characters

- LATIN CAPITAL LETTER A through LATIN CAPITAL LETTER Z,
- DIGIT ZERO through DIGIT NINE,
- SPACE,
- HYPHEN-MINUS, and
- FULL STOP if the entity being named is a collection

The first character in an entity name shall be a Latin capital letter. The last character in an entity name shall be either a Latin capital letter or a Digit.

An entity name shall not contain two or more consecutive SPACE characters or consecutive HYPHEN-MINUS characters. A collection name shall not contain two or more consecutive FULL STOP characters.

A sequence of a SPACE followed by a HYPHEN-MINUS or a sequence of a HYPHEN-MINUS followed by a SPACE may appear only in character names or named UCS sequence identifiers.

EXAMPLE 1 Each of the following two character names contains a consecutive SPACE and HYPHEN-MINUS:

TIBETAN LETTER -A

TIBETAN MARK BKA- SHOG YIG MGO

FULL STOP may appear only in between two alpha-numeric characters (LATIN CAPITAL LETTER A through LATIN CAPITAL LETTER Z, DIGIT ZERO through DIGIT NINE) in a collection name.

EXAMPLE 2 The following collection name contains FULL STOP in between two Digits, DIGIT FOUR and DIGIT ONE:

UNICODE 4.1

EXAMPLE 3 The following collection name contains FULL STOP in between one Latin letter, LATIN CAPITAL LETTER D, and a Digit, DIGIT SEVEN:

BMP-AMD.7

24.3 Single name

Each entity named in this standard shall be given only one name.

NOTE – This does not preclude the informative use of name aliases or acronyms for the sake of clarity. However, the normative entity name will be unique. These informative aliases should not be confused with character name aliases which share the same namespace as character names and are normative.

24.4 Name immutability

Some entity names cannot be changed by future versions of this standard. This applies to character name and character name aliases. See 7.

24.5 Name uniqueness

Each entity name must also be unique within an appropriate name space, as specified here.

24.5.1 Block names

Block names constitute a name space. Each block name shall be unique and distinct from all other block names specified in the standard.

24.5.2 Collection names

Collection names constitute a name space. Each collection name shall be unique and distinct from all other collection names specified in the standard.

24.5.3 Character names, character name aliases, and named UCS sequence identifiers

Character names, character name aliases and named UCS sequence identifiers, taken together, constitute a name space. Each character name, character name aliases, or named UCS sequence identifier shall be unique and distinct from all other character names, character name aliases, or named UCS sequence identifiers.

24.5.4 Determining uniqueness

For block names and collection names, two names shall be considered unique and distinct if they are different even when SPACE and medial HYPHEN-MINUS characters are ignored in comparison of the names.

NOTE 1 – A medial HYPHEN-MINUS is a HYPHEN-MINUS character that occurs immediately after a character other than SPACE and immediately before a character other than SPACE.

EXAMPLE 1 The following hypothetical block names would be unique and distinct:

LATIN-A
LATIN-B

EXAMPLE 2 The following hypothetical block names would not be unique and distinct:

LATIN-A
LATIN A
LATINA

For character names and named UCS sequence identifiers, two names shall be considered unique and distinct if they are different even when SPACE and medial HYPHEN-MINUS characters are ignored and even when the words "LETTER", "CHARACTER", and "DIGIT" are ignored in comparison of the names.

EXAMPLE 3 The following hypothetical character names would not be unique and distinct:

MANICHAEAN CHARACTER A
MANICHAEAN LETTER A

EXAMPLE 4: The following two actual character names are unique and distinct, because they differ by a HYPHEN-MINUS that is not a medial HYPHEN-MINUS:

TIBETAN LETTER A
TIBETAN LETTER -A

The following two character names shall be considered unique and distinct:

HANGUL JUNGSEONG OE
HANGUL JUNGSEONG O-E

NOTE 2 – These two character names are explicitly handled as an exception, because they were defined in an earlier version of this International Standard before the introduction of the name uniqueness requirement. This pair is, has been, and will be the only exception to the uniqueness rule in this International Standard.

24.6 Character names for CJK Ideographs

For CJK Ideographs the names are algorithmically constructed by appending their coded representation in hexadecimal notation to "CJK UNIFIED IDEOGRAPH-" for CJK Unified Ideographs and "CJK COMPATIBILITY IDEOGRAPH-" for CJK Compatibility Ideographs.

For CJK Ideographs within the BMP, the coded representation is their two-octet value expressed as four hexadecimal digits. For example, the first CJK Ideograph character in the BMP has the name "CJK UNIFIED IDEOGRAPH-3400".

For CJK Ideographs within the SIP, the coded representation is their five hexadecimal digit value. For example, the first CJK Ideograph character in the SIP has the name "CJK UNIFIED IDEOGRAPH-20000".

24.7 Character names for Hangul syllables

Names for the Hangul syllable characters in code points AC00 - D7A3 are derived from their code point values by the numerical procedure described below. Lists of names for these characters are not provided in the code charts.

- 1) Obtain the code point of the Hangul syllable character. It is of the form $h_1h_2h_3h_4$ where h_1 , h_2 , h_3 , and h_4 are hexadecimal digits representing the number $h_1h_2h_3h_4$ lying within the range AC00 to D7A3.
- 2) Derive the decimal numbers d_1 , d_2 , d_3 , d_4 that are numerically equal to the hexadecimal digits h_1 , h_2 , h_3 , h_4 respectively.
- 3) Calculate the character index C from the formula

$$C = 4096 \times (d_1 - 10) + 256 \times (d_2 - 12) + 16 \times d_3 + d_4$$
- 4) Calculate the syllable component indices I , P , F from the following formulae

$$I = C / 588 \quad (\text{Note: } 0 \leq I \leq 18)$$

$$P = (C \% 588) / 28 \quad (\text{Note: } 0 \leq P \leq 20)$$

$$F = C \% 28 \quad (\text{Note: } 0 \leq F \leq 27)$$
 where “/” indicates integer division (i.e. x / y is the integer quotient of the division), and “%” indicates the modulo operation (i.e. $x \% y$ is the remainder after the integer division x / y).
- 5) Obtain the Latin character strings that correspond to the three indices I , P , F from columns 2, 3, and 4 respectively of table 1 below (for $I = 11$ and for $F = 0$ the corresponding strings are null). Concatenate these three strings in left-to-right order to make a single string, the syllable-name.
- 6) The character name for the character code point $h_1h_2h_3h_4$ is then
 HANGUL SYLLABLE $s\text{-}n$
 where “ $s\text{-}n$ ” indicates the syllable-name string derived in step 5.

EXAMPLE

For the character with code point D4DE:

$d_1 = 13$, $d_2 = 4$, $d_3 = 13$, $d_4 = 14$.

$C = 10462$

$I = 17$, $P = 16$, $F = 18$.

The corresponding Latin character strings are P, WI, BS. The syllable-name is PWIBS, and the character name is HANGUL SYLLABLE PWIBS

For each Hangul syllable, character short additional information is defined and available in Annex R along with each character name. This additional information consists of an alternative transliteration of the Hangul syllable into Latin characters. They are also derived from their code point values by a similar numerical procedure described below.

- 7) Carry out steps 1 to 4 as described above.
- 8) Obtain the Latin character strings that correspond to the three indices I , P , F from columns 5, 6, and 7 respectively of Table 1 below (for $I = 11$ and for $F = 0$ the corresponding strings are null). Concatenate these three strings in left-to-right order to make a single string.

EXAMPLE

For the character with code point D4DE:

$d_1 = 13$, $d_2 = 4$, $d_3 = 13$, $d_4 = 14$.

$C = 10462$

$I = 17$, $P = 16$, $F = 18$.

The corresponding Latin character strings are ph, wi, ps; and the additional information is phwips.

NOTE – The Annex R provides the names of Hangul syllables through a linked file.

Table 5: Elements of Hangul syllable names and additional information

Index number	Syllable name elements			Additional information		
	<i>I</i> string	<i>P</i> string	<i>F</i> string	<i>I</i> string	<i>P</i> string	<i>F</i> string

25 Named UCS Sequence Identifiers

A Named UCS Sequence Identifier (NUSI) is a USI associated to a name following the same construction rules as for character names. These rules are given in 24.

NOTE 1 – The purpose of these named USIs is to specify sequences of characters that may be treated as single units, either in particular types of processing, in reference by standards, in listing of repertoires (such as for fonts or keyboards).

The USI value corresponding to each NUSI is written using the coded representation determined by the normalization form NFC (see 21). Each named UCS sequence has a unique code representation. All allowed named UCS sequence identifiers for use with ISO/IEC 10646 are specified in the content linked below. All other such named sequences are undefined.

The content linked to is a plain text file, using ISO/IEC 646-IRV characters with LINE FEED as end of line mark, that specifies after a 5-lines header, Named UCS Sequence Identifiers; each line containing the following information organized in fields delimited by ‘;’:

- 1st field: Name of the NUSI (following rules given in 24)
- 2nd UCS sequence: (<space>)* (hhhh|hnhhh|hhhhhh) (<space> (hhhh|hnhhh|hhhhhh))+

The format definition uses ‘h’ as a decimal unit and <space> as the SPACE character.

[Click on this highlighted text to access the reference file.](#)

ISO/IEC 10646:2010 (E) Final Committee Draft (FCD)

NOTE 2 – The content is also available as a separate viewable file in the same file directory as this document. The file is named "NUSI.txt".

NOTE 3 – All the allowed Named UCS Sequence Identifiers for use with ISO/IEC 10646 are also specified in the Unicode Standard UAX#34 (Unicode Named Character Sequences: <http://www.unicode.org/reports/tr34/>).

26 Structure of the Basic Multilingual Plane

An overview of the Basic Multilingual Plane is shown in figure 5 and a more detailed overview of Rows 00 to 33 is shown in figure 6. The Basic Multilingual Plane includes characters in general use in alphabetic, syllabic, and ideographic scripts together with various symbols and digits.

Figure 6 - Overview of Rows 00 to 33 of the Basic Multilingual Plane

27 Structure of the Supplementary Multilingual Plane for scripts and symbols (SMP)

Because another supplementary plane is reserved for additional CJK Ideographs, the SMP (plane 1) is not used to date for encoding CJK Ideographs. Instead, the SMP is used for encoding graphic characters used in other scripts of the world that are not encoded in the BMP. Most, but not all, of the scripts encoded to date in the SMP are not in use as living scripts by modern user communities.

NOTE 1 – The following subdivision of the SMP has been proposed:

- Alphabetic scripts,
- Hieroglyphic, ideographic and syllabaries,
- Non CJK ideographic scripts,
- Newly invented scripts,
- Symbol sets

An overview of the Supplementary Multilingual Plane for scripts and symbols is shown in figure 7.

= reserved for future standardization

NOTE 2 – Vertical boundaries within rows are indicated in approximate positions only.

NOTE 3 – The Old Italic block represents a unified script that covers the Etruscan, Oscan, Umbrian, Faliscan, North Picene, and South Picene alphabets. Some of these alphabets can be written with characters oriented in either left-to-right or right-to-left direction. The glyphs in the code chart are shown with left to right orientation.

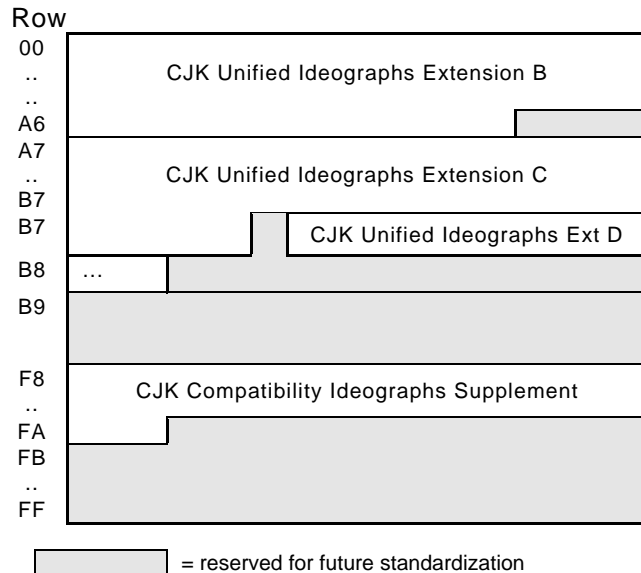

Figure 7 – Overview of the Supplementary Multilingual Plane for scripts and symbols

28 Structure of the Supplementary Ideographic Plane (SIP)

The SIP (plane 2) is used for CJK unified ideographs (unified East Asian ideographs) that are not encoded in the BMP. The procedures for the unification and the rules for their arrangement are described in Annex S.

The SIP is also used for compatibility CJK ideographs. These ideographs are compatibility characters as specified in 18.

The following figure 8 shows an overview of the Supplementary Ideographic Plane.

NOTE – Vertical boundaries within rows are indicated in approximate positions only.

Figure 8 – Overview of the Supplementary Ideographic Plane

29 Structure of the Supplementary Special-purpose Plane (SSP)

The SSP (plane 0E) is used for special purpose use graphic characters.

An overview of the Supplementary Special-purpose Plane is shown in figure 9.

NOTE 2 – Unassigned code points in this range should be ignored in normal processing and display.

NOTE 3 – Vertical boundaries within rows are indicated in approximate positions only.

Figure 9 – Overview of the Supplementary Special-purpose Plane

30 Code charts and lists of character names

Detailed code charts and lists of character names for the BMP, SMP, SIP and SSP are shown on the following pages. Code charts are arranged by blocks which may span several pages.

Each code chart is followed by a corresponding character names list, except the CJK UNIFIED IDEOGRAPHS blocks and the HANGUL SYLLABLES block.

NOTE – A block code chart and name list may be arranged in a single page if their contents allow it.

30.1 Code chart

Code charts are presented in arrays of graphic symbols representing the characters organized in one to sixteen columns of sixteen symbols each. The lower digit of the coded representation is indicated in the left margin while the remaining upper digits are indicated in the top margin. The full coded representation for each character is also indicated under each representative graphic symbol.

30.2 Character names list

The character names lists contain both normative and informative information. The following information items are normative:

- Character code point,
- Associated character name,
- Character name alias (one preceded by ‘※’).

All other information is informative and may contain:

- Graphic symbol associated with the character,
- Subheads grouping various subsets of a given block. For example, the LATIN-1 SUPPLEMENT block contain “Latin-1 punctuation and symbols”, “Letters”, and “Mathematical operator”,
- Explanatory text describing context for a subhead or a whole block,
- Informative aliases, preceded by ‘=’, indicating alternate names for characters,
- Cross references, preceded by ‘→’, indicating a related character of interest,
- Information about languages, preceded by ‘•’, indicating a non exhaustive list of languages using that character. For bicameral scripts, the information is only provided for the lower case form of the character,
- Case mappings, also preceded by ‘•’, only when it cannot be derived simply from the names,
- Other information about a character, also preceded by ‘•’, describing name peculiarity, historical consideration, or any noteworthy aspect of a character,
- Decomposition mappings, preceded by ‘≡’ for canonical mappings, and by ‘≈’ for compatibility mappings.

NOTE – The decomposition mappings syntax is described in more details in section 17.1 of the Unicode Standard Version 6.0.

The following example describes various fragments of name lists including these informative items.

EXAMPLE

284	CONTEMPORARY LITHUANIAN LETTERS	see A.5.4 *
285	BASIC JAPANESE	see A.5.5 *
286	JAPANESE NON IDEOGRAPHICS EXTENSION	see A.5.6 *
287	COMMON JAPANESE	see A.5.7 *
288	MULTILINGUAL LATIN SUBSET	see A.5.8
300	BMP	0000-D7FF E000-FFFF
400	(This collection number shall not be used, see Note 3.)	
401	PRIVATE USE PLANES-0F-10	G=00, P=0F-10
500	(This collection number shall not be used, see Note 3.)	
1000	SMP	10000-1FFFF
1900	SMP COMBINING CHARACTERS	SMP characters specified in clause 4.14
2000	SIP	20000-2FFFF
3000	SSP	E0000-EFFFF

The following specify collections which are the union of particular collections defined above.

63	ALPHABETIC PRESENTATION FORMS	Collections 104-105
250	GENERAL FORMAT CHARACTERS	Collections 200-203
251	SCRIPT-SPECIFIC FORMAT CHARACTERS	Collections 204-206
4000	UCS PART-2	Collections 1000, 2000, 3000

NOTE 2 – Collections numbered 57, 58, and 59 were specified in the First Edition of ISO/IEC 10646-1 but have now been deleted. Collections numbered 400 and 500 were specified in the First and Second Editions of ISO/IEC 10646-1 but have now been deleted. The collection numbered 271 was specified in the first edition of ISO/IEC 10646 but has now been deleted.

NOTE 3 – The principal terms (keywords) used in the collection names shown above are listed below in alphabetical order. The entry for a term shows the collection number of every collection whose name includes the term. These terms do not provide a complete cross-reference to all the collections where characters sharing a particular attribute, such as script name, may be found. Although most of the terms identify an attribute of the characters within the collection, some characters that possess that attribute may be present in other collections whose numbers do not appear in the entry for that term.

A.2.3 Blocks in the SIP

The following blocks are specified in the Supplementary Ideographic Plane. They are ordered by code point.

<u>Block name</u>	<u>from</u>	<u>to</u>
CJK UNIFIED IDEOGRAPHS EXTENSION B	20000-2A6DF	
CJK UNIFIED IDEOGRAPHS EXTENSION C	2A700-2B73F	
CJK UNIFIED IDEOGRAPHS EXTENSION D	2B740-2B81F	
CJK COMPATIBILITY IDEOGRAPHS SUPPLEMENT	2F800-2FA1F	

A.2.4 Blocks in the SSP

The following blocks are specified in the Supplementary Special-purpose Plane. They are ordered by code point.

<u>Block name</u>	<u>from</u>	<u>to</u>
TAGS	E0000-E007F	
VARIATION SELECTORS SUPPLEMENT	E0100-E01EF	

A.3 Fixed collections of the whole UCS (except Unicode collections)

The following fixed collections (see 4.26) contain the whole UCS assigned character content as it was when they were created. The Unicode collections are described in A.1.

A.3.1 301 BMP-AMD.7

The fixed collection 301 BMP-AMD.7 is specified below. It comprises only those coded characters that were in the BMP after amendments up to, but not after, AMD.7 were applied to the First Edition of ISO/IEC 10646-1. Accordingly the repertoire of this collection is not subject to change if new characters are added to the BMP by any subsequent amendments.

301 BMP-AMD.7 is specified by the following ranges of code points as indicated for each row or contiguous series of rows.

Plane 00

<u>Row</u>	<u>Values within row</u>

A.3.2 299 BMP FIRST EDITION

The fixed collection 299 BMP FIRST EDITION has been reserved to identify all of the coded characters that were in the BMP in the First Edition of ISO/IEC 10646-1. This collection is not now in conformity with this International Standard.

NOTE – The specification of collection 299 BMP FIRST EDITION consisted of the specification of collection 301 BMP-AMD.7 except for the replacement of the corresponding entries in the list above with the entries shown below:

Row	Values within row
05	31-56 59-5F 61-87 89 B0-B9 BB-C3 D0-EA F0-F4
0F	[no values]
1E	00-9A A0-F9
20	00-2E 30-46 6A-70 74-8E A0-AA D0-E1
AC-D7	[no values]

and by including an additional entry:

Row	Values within row
34-4D	3400-4DFF

for the code point values of three collections (57, 58, 59) of coded characters which have been deleted from this International Standard since the First Edition of ISO/IEC 10646-1.

A.3.3 302 BMP SECOND EDITION

The fixed collection 302 BMP SECOND EDITION comprises only those coded characters that are in the BMP in the Second Edition of ISO/IEC 10646-1. The repertoire of this collection is not subject to change if new characters are added to the BMP by any subsequent amendments.

302 BMP SECOND EDITION is specified by the following ranges of code points as indicated for each row or contiguous series of rows.

Plane 00

Row	Values within row

A.3.4 340 COMBINED FIRST EDITION

The fixed collection 340 COMBINED FIRST EDITION is specified below. It comprises only those coded characters that were in the First Edition of ISO/IEC 10646:2003 and consists of collections from A.1 and A.3 and several ranges of code points. The collection list is arranged by planes as follows.

Plane 00

A.4 CJK collections**A.4.1 370 IICORE**

The fixed collection 370 IICORE is the International Core subset of the CJK UNIFIED IDEOGRAPHS-2001 collection.

NOTE 1 – Given its large size (9 810 characters) and the large number of sparse ranges, the collection is not specified by code point ranges in this document but instead by a linked content.

The content linked to is a plain text file, using ISO/IEC 646-IRV characters with LINE FEED as end of line mark, that specifies, after a 11-lines header, as many lines as IICORE characters; each containing the following information in fixed length field.

- 1st field: BMP or SIP code point (0hhhh), (2hhhh), normative.
- 2nd field: Hanzi G usage identifier (G0a), (G1a), (G3a), (G5a), (G7a), (G8a), (G9a), or (GEa), informative.
- 3rd field: Hanzi T usage identifier (T1a), (T2a), (T3a), (T4a), (T5a) or (TFa), informative.
- 4th field: Kanji J usage identifier (J1A), in-formative.
- 5th field: Hanzi H usage identifier (H1a), in-formative.
- 6th field: Hanja K usage identifier (K0a), (K1a), (K2a) or (K3a), informative.
- 7th field: Hanzi M (for Macao SAR) usage identifier (M1a), informative.
- 8th field: Hanja KP usage identifier (P0a), informative.

- 9th field: General category, informative (A, B or C in decreasing order of priority).

The format definition uses 'h' as a hexadecimal unit and 'a' as an enumerated unit for letters from 'A' to 'G'. Uppercase characters and digits between parentheses appear as shown.

NOTE 2 – The usage information provided in this subclause describes the usage and priority level of individual IICORE characters in the context of each source (G, T, J, H, K, M, and KP). This should not be confused with the source references for CJK Ideographs in clause 22.4 which establish the identity of all CJK Ideographs.

[Click on this highlighted text to access the reference file.](#)

NOTE 3 – The content is also available as a separate viewable file in the same file directory as this document. The file is named: "IICORE.txt".

A.4.2 371 JIS2004 IDEOGRAPHICS EXTENSION

The fixed collection 371 JIS2004 IDEOGRAPHICS EXTENSION consists of all level 3 and level 4 CJK characters defined in JIS X 0213:2004.

NOTE 1 – Given its large size (3 695 characters) and the large number of sparse ranges, the collection is not specified by code point ranges in this document but instead by a linked content.

The content linked to is a plain text file, using ISO/IEC 646-IRV characters with LINE FEED as end of line mark, that specifies, after a 3-lines header, as many lines as characters in the collection; each containing the following information in fixed length field:

- BMP or SIP code point (0hhhh), (2hhhh), normative.

The format definition uses 'h' as a hexadecimal unit. Digits between parentheses appear as shown.

[Click on this highlighted text to access the reference file.](#)

NOTE 2 – The content is also available as a separate viewable file in the same file directory as this document. The file is named: "JIEEx.txt".

A.4.3 372 JAPANESE IDEOGRAPHICS SUPPLEMENT

The fixed collection 372 JAPANESE IDEOGRAPHICS SUPPLEMENT consists of all CJK characters defined in JIS X 0212:1990. It contains 5 801 characters.

NOTE – 2 742 characters are common between the collections 371 and 372.

The code points of this collection are identified by the J1 Kanji J sources in the Source Reference file for CJK Unified Ideographs (CJKU_SR.txt). See 0 for further details.

A.5 Other collections

The collections specified within this clause address the referencing need of users community. Characters may be from different writing systems and may be coded in different planes. It includes collection for users community from Lithuania, Japan and Europe as a whole.

NOTE – The acronym MES used in collection names below indicates Multilingual European Subset.

A.5.1 281 MES-1

The fixed collection 281 MES-1 is specified by the following ranges of code points as indicated for each row.

Plane 00

<u>Row</u>	<u>Values within row</u>
00	20-7E A0-FF
01	00-13 16-2B 2E-4D 50-7E

A.5.3 283 MODERN EUROPEAN SCRIPTS

The collection 283 MODERN EUROPEAN SCRIPTS is specified by the following collections:

<u>Collection number and name</u>		
1	BASIC LATIN	34 CURRENCY SYMBOLS
2	LATIN-1 SUPPLEMENT	35 COMBINING DIACRITICAL MARKS FOR SYMBOLS
3	LATIN EXTENDED-A	36 LETTERLIKE SYMBOLS
4	LATIN EXTENDED-B	37 NUMBER FORMS
5	IPA EXTENSIONS	38 ARROWS
6	SPACING MODIFIER LETTERS	39 MATHEMATICAL OPERATORS
7	COMBINING DIACRITICAL MARKS	40 MISCELLANEOUS TECHNICAL
8	BASIC GREEK	42 OPTICAL CHARACTER RECOGNITION
9	GREEK SYMBOLS AND COPTIC	44 BOX DRAWING
10	CYRILLIC	45 BLOCK ELEMENTS
11	ARMENIAN	46 GEOMETRIC SHAPES
27	BASIC GEORGIAN	47 MISCELLANEOUS SYMBOLS
30	LATIN EXTENDED ADDITIONAL	65 COMBINING HALF MARKS
31	GREEK EXTENDED	70 SPECIALS
32	GENERAL PUNCTUATION	92 CYRILLIC SUPPLEMENT
33	SUPERSCRIPTS AND SUBSCRIPTS	104 LTR ALPHABETIC PRESENTATION FORMS

A.5.4 284 CONTEMPORARY LITHUANIAN LETTERS

The fixed extended collection 284 CONTEMPORARY LITHUANIAN LETTERS is defined as follows.

Plane 00

<u>Row</u>	<u>Values within row</u>

A.5.5 285 BASIC JAPANESE

The fixed collection 285 BASIC JAPANESE is a core Japanese subset. Its 6 884 characters are identified by:

- All J0 Kanji J sources in the Source Reference file for CJK Unified Ideographs (CJKU_SR.txt). See 0 for further details.
- Ranges of code points arranged by planes:

Plane 00

Annex B
(normative)
List of combining characters

NOTE – Replaced by formal character class definition, see 4.14

Annex C
(normative)

Transformation format for planes 1 to 10 of the UCS (UTF-16)

NOTE – Incorporated in main body text, see UCS UTF-16 encoding form in 9 and UCS UTF-16 based encoding schemes in 10.

Annex D
(normative)
UCS Transformation Format 8 (UTF-8)

NOTE – Incorporated in main body text, see UCS UTF-8 encoding form in 9 and UCS UTF-8 encoding schemes in 10.

Annex E
(normative)

Mirrored characters in bidirectional context

NOTE – Replaced by formal character class definition for mirrored character, see 15.1.

Annex F (informative) Format characters

There is a special class of characters, called Format characters, the primary purpose of which is to affect the layout or processing of characters around them. With few exceptions, these characters do not have printable graphic symbols and, like the space characters, are represented in the character code charts by dotted boxes.

The function of most of these characters is to indicate the correct presentation of a CC-data element. For any text processing other than presentation (such as sorting and searching), the format characters, except for ZWJ and ZWNJ described in F.1.1, can be ignored by filtering them out. The format characters are not intended to be used in conjunction with bidirectional control functions from ISO/IEC 6429.

F.1 General format characters

F.1.1 Zero-width boundary indicators

The following characters are used to indicate whether or not the adjacent characters are separated by a word boundary or hyphenation boundary. Each of these zero-width boundary indicators has no width in its usual own presentation.

SOFT HYPHEN (00AD): SOFT HYPHEN (SHY) is a format character that indicates a preferred intra-word line-break opportunity. If the line is broken at that point, then whatever mechanism is appropriate for intra-word line-breaks should be invoked, just as if the line break had been triggered by another mechanism, such as a dictionary lookup. Depending on the language and the word, that may produce different visible results, such as:

- inserting a graphic symbol indicating the hyphenation and breaking the line after it,
- inserting a graphic symbol indicating the hyphenation, breaking the line after the symbol and changing spelling in the divided word parts,
- not showing any visible change and simply breaking the line at that point.

The inserted graphic symbol, if any, can take a wide variety of shapes, such as HYPHEN (2010), ARMENIAN HYPHEN (058A), MONGOLIAN TODO SOFT HYPHEN (1806), as appropriate for the situation.

When encoding text that includes explicit line breaking opportunities, including actual hyphenations, characters such as HYPHEN, ARMENIAN HYPHEN, and MONGOLIAN TODO SOFT HYPHEN may be used, depending on the language.

When a SOFT HYPHEN is inserted into a CC-data-element to encode a possible hyphenation point (for example: "tug{00AD}gumi"), the character representation remains otherwise unchanged. When encoding a CC-data-element that includes characters encoding hard line breaks, including actual hyphenations, the character representation of the text sequence must reflect any changes due to hyphenation (for example: "tugg{2010}" / "gumi", where / represents the line break).

NOTE 2 – The notations {00AD} and {2010} indicate the inclusion of the corresponding code points: 00AD and 2010 into the CC-data-elements. The curly brackets "{}" are not part of the CC-data elements.

ZERO WIDTH SPACE (200B): This character behaves like a SPACE in that it indicates a word boundary, but unlike SPACE it has no presentational width. For example, this character could be used to indicate word boundaries in Thai, which does not use visible gaps to separate words.

WORD JOINER (2060) and **ZERO WIDTH NO-BREAK SPACE** (FEFF): These characters behave like a NO-BREAK SPACE in that they indicate the absence of word boundaries, but unlike NO-BREAK SPACE they have no presentational width. For example, these characters could be inserted after the fourth character in the text "base+delta" to indicate that there is to be no word break between the "e" and the "+".

NOTE 3 – For additional usages of the ZERO WIDTH NO-BREAK SPACE for "signature", see Annex H.

The following characters are used to indicate whether or not the adjacent characters are joined together in rendering (cursive joiners).

ZERO WIDTH NON-JOINER (200C): This character indicates that the adjacent characters are not joined together in cursive connection even when they would normally join together as cursive letter forms. For example, ZERO WIDTH NON-JOINER between ARABIC LETTER NOON and ARABIC LETTER MEEM indicates that the characters are not rendered with the normal cursive connection.

ZERO WIDTH JOINER (200D): This character indicates that the adjacent characters are represented with joining forms in cursive connection even when they would not normally join together as cursive letter forms. For example, in the sequence SPACE followed by ARABIC LETTER BEH followed by SPACE, ZERO WIDTH JOINER can be inserted between the first two characters to display the final form of the ARABIC LETTER BEH.

F.1.2 Format separators

The following characters are used to indicate formatting boundaries between lines or paragraphs.

LINE SEPARATOR (2028): This character indicates where a new line starts; although the text continues to the next line, it does not start a new paragraph; e.g. no inter-paragraph indentation might be applied.

PARAGRAPH SEPARATOR (2029): This character indicates where a new paragraph starts; e.g. the text continues on the next line and inter-paragraph line spacing or paragraph indentation might be applied.

F.1.3 Bidirectional text formatting

The following characters are used in formatting bidirectional text. If the specification of a subset includes these characters, then texts containing right-to-left characters are to be rendered with an implicit bidirectional algorithm.

An implicit algorithm uses the directional character properties to determine the correct display order of characters on a horizontal line of text.

The following characters are format characters that act exactly like right-to-left or left-to-right characters in terms of affecting ordering (Bidirectional format marks). They have no visible graphic symbols, and they do not have any other semantic effect.

Their use can be more convenient than the explicit embeddings or overrides, since their scope is more local.

LEFT-TO-RIGHT MARK (200E): In bidirectional formatting, this character acts like a left-to-right character (such as LATIN SMALL LETTER A).

RIGHT-TO-LEFT MARK (200F): In bidirectional formatting, this character acts like a right-to-left character (such as ARABIC LETTER NOON).

The following format characters indicate that a piece of text is to be treated as embedded, and is to have a particular ordering attached to it (Bidirectional format embeddings). For example, an English quotation in the middle of an Arabic sentence can be marked as being an embedded left-to-right string. These format characters nest in blocks, with the embedding and override characters initiating (pushing) a block, and the pop character terminating (popping) a block.

The function of the embedding and override characters are very similar; the main difference is that the embedding characters specify the implicit direction of the text, while the override characters specify the explicit direction of the text. When text has an explicit direction, the normal directional character properties are ignored, and all of the text is assumed to have the ordering direction determined by the override character.

LEFT-TO-RIGHT EMBEDDING (202A): This character is used to indicate the start of a left-to-right implicit embedding.

RIGHT-TO-LEFT EMBEDDING (202B): This character is used to indicate the start of a right-to-left implicit embedding.

LEFT-TO-RIGHT OVERRIDE (202D): This character is used to indicate the start of a left-to-right explicit embedding.

RIGHT-TO-LEFT OVERRIDE (202E): This character is used to indicate the start of a right-to-left explicit embedding.

POP DIRECTIONAL FORMATTING (202C): This character is used to indicate the termination of an implicit or explicit directional embedding initiated by one of the four characters above.

F.2 Script-specific format characters

F.2.1 Khmer Vowel Inherent characters

The use of these characters is discouraged. They were intended to be used to represent phonetic differences in a model which is now deprecated.

KHMER VOWEL INHERENT AQ (17B4)

KHMER VOWEL INHERENT AA (17B5)

F.2.2 Symmetric swapping format characters

The following characters are used in conjunction with the class of left/right handed pairs of mirrored characters described in clause 15. The following format characters indicate whether the interpretation of the term LEFT or RIGHT in the character names is OPENING or CLOSING respectively. The following characters do not nest.

The default state of interpretation may be set by a higher level protocol or standard, such as ISO/IEC 6429. In the absence of such a protocol, the default state is as established by **ACTIVATE SYMMETRIC SWAPPING**.

INHIBIT SYMMETRIC SWAPPING (206A): Between this character and the following **ACTIVATE SYMMETRIC SWAPPING** format character (if any), the mirrored characters described in clause 15 are interpreted and rendered as LEFT and RIGHT, and the processing specified in that clause is not performed.

ACTIVATE SYMMETRIC SWAPPING (206B): Between this character and the following **INHIBIT SYMMETRIC SWAPPING** format character (if any), the mirrored characters described in clause 15 are interpreted and rendered as OPENING and CLOSING characters as specified in that clause.

F.2.3 Character shaping selectors

The following characters are used in conjunction with Arabic presentation forms. During the presentation process, certain characters may be joined together in cursive connection or ligatures. The following characters indicate that the character shape determination process used to achieve this presentation effect is either activated or inhibited. The following characters do not nest.

INHIBIT ARABIC FORM SHAPING (206C): Between this character and the following **ACTIVATE ARABIC FORM SHAPING** format character (if any), the character shaping determination process is inhibited. The stored Arabic presentation forms are presented without shape modification. This is the default state.

ACTIVATE ARABIC FORM SHAPING (206D): Between this character and the following **INHIBIT ARABIC FORM SHAPING** format character (if any), the stored Arabic presentation forms are presented with shape modification by means of the character shaping determination process.

NOTE – These characters have no effect on characters that are not presentation forms: in particular, Arabic nominal characters as from 0600 to 06FF are always subject to character shaping, and are unaffected by these formatting characters.

F.2.4 Numeric shape selectors

The following characters allow the selection of the shapes in which the digits from 0030 to 0039 are rendered. The following characters do not nest.

NATIONAL DIGIT SHAPES (206E): Between this character and the following NOMINAL DIGIT SHAPES format character (if any), digits from 0030 to 0039 are rendered with the appropriate national digit shapes as specified by means of appropriate agreements. For example, they could be displayed with shapes such as the ARABIC-INDIC digits from 0660 to 0669.

NOMINAL DIGIT SHAPES (206F): Between this character and the following NATIONAL DIGIT SHAPES format character (if any), the digits from 0030 to 0039 are rendered with the shapes as those shown in the code charts for those digits. This is the default state.

F.3 Interlinear annotation characters

The following characters are used to indicate that an identified character string (the annotation string) is regarded as providing an annotation for another identified character string (the base string).

INTERLINEAR ANNOTATION ANCHOR (FFF9): This character indicates the beginning of the base string.

INTERLINEAR ANNOTATION SEPARATOR (FFFA): This character indicates the end of the base string and the beginning of the annotation string.

INTERLINEAR ANNOTATION TERMINATOR (FFFB): This character indicates the end of the annotation string.

The relationship between the annotation string and the base string is defined by agreement between the user of the originating device and the user of the receiving device. For example, if the base string is rendered in a visible form the annotation string may be rendered on a different line from the base string, in a position close to the base string.

If the interlinear annotation characters are filtered out during processing, then all characters between the Interlinear Annotation Separator and the Interlinear Annotation Terminator should also be filtered out.

F.4 Subtending format characters

The following characters are used to subtend a sequence of subsequent characters:

0600	ARABIC NUMBER SIGN
0601	ARABIC SIGN SANAH
0602	ARABIC FOOTNOTE MARKER
0603	ARABIC SIGN SAFHA
06DD	ARABIC END OF AYAH
070F	SYRIAC ABBREVIATION MARK
110BD	KAITHI NUMBER SIGN

The scope of these characters is the subsequent sequence of digits (plus certain other characters), with the exact specification as defined in the Unicode Standard, Version 6.0 (see Annex M for referencing information), for ARABIC END OF AYAH.

F.5 Contiguity operators

These format characters provide separators between characters where punctuation or SPACE may be omitted in mathematical expressions.

FUNCTION APPLICATION (2061): This character indicates the application of a function.

INVISIBLE TIMES (2062): This character indicates a multiplication.

INVISIBLE SEPARATOR (2063): This character indicates that adjacent mathematical symbols form a list, e.g. when no visible COMMA is used between multiple indices.

INVISIBLE PLUS (2064): This character indicates an addition.

F.6 Western musical symbols

This international standard does not specify an encoding solution for musical scores or musical pitch. Solutions for these needs would require another description layer on top of the encoding definition of the characters specified in this standard. However, even without that additional layer, these characters can be used as simple musical reference symbols for general purposes in text descriptions of musical matters.

Extended beams are used frequently in music notation between groups of notes having short values. The format characters 1D173 MUSICAL SYMBOL BEGIN BEAM and 1D174 MUSICAL SYMBOL END BEAM can be used to indicate the extents of beam groupings. In some exceptional cases, beams are unclosed on one end. This can be indicated with a "null note" (MUSICAL SYMBOL NULL NOTEHEAD) character if no stem is to appear at the end of the beam.

Similarly, other format characters have been provided for other connecting structures. The characters

1D175 MUSICAL SYMBOL BEGIN TIE
1D176 MUSICAL SYMBOL END TIE
1D177 MUSICAL SYMBOL BEGIN SLUR
1D178 MUSICAL SYMBOL END SLUR
1D179 MUSICAL SYMBOL BEGIN PHRASE
1D17A MUSICAL SYMBOL END PHRASE

indicate the extent of these features.

These pairs of characters modify the layout and grouping of notes and phrases in full music notation. When musical examples are written or rendered in plain text without special software, the start/end control characters may be rendered as brackets or left un-interpreted. More sophisticated in-line processes may interpret them, to the extent possible, in their actual control capacity, rendering ties, slurs, beams, and phrases as appropriate.

For maximum flexibility, the character set includes both pre-composed note values as well as primitives from which complete notes are constructed. Due to their ubiquity, the pre-composed versions are provided mainly for convenience.

Coding convenience notwithstanding, notes built up from alternative noteheads, stems and flags, and articulation symbols are necessary for complete implementations and complex scores. Examples of their use include American shape-note and modern percussion notations. For example,

MUSICAL SYMBOL SQUARE NOTEHEAD BLACK + MUSICAL SYMBOL COMBINING STEM
MUSICAL SYMBOL X NOTEHEAD + MUSICAL SYMBOL COMBINING STEM

Augmentation dots and articulation symbols may be appended to either the pre-composed or built-up notes.

In addition, augmentation dots and articulation symbols may be repeated as necessary to build a complete note symbol. For example,

MUSICAL SYMBOL EIGHTH NOTE + MUSICAL SYMBOL COMBINING AUGMENTATION DOT + MUSICAL SYMBOL COMBINING AUGMENTATION DOT + MUSICAL SYMBOL COMBINING ACCENT

F.7 Language tagging using Tag characters

The purpose of Tag characters is to associate a text attribute with a point or range of a text string. The value of a particular tag is not generally considered to be part of the content of the text. For example, tagging could be used to mark the language or the font applied to a portion of text. Outside of that usage, these characters are ignorable.

These tag characters can be used to spell out a character string in any ASCII-based tagging scheme that needs to be embedded into plain text. These characters can be easily identified by their code value and there is no overloading of usage for these tag characters. They can only express tag values and never textual content itself.

When characters are used within the context of a protocol or syntax containing explicit markup providing the same association, the Tag characters may be filtered out and ignored by these protocols.

For example, in SGML/XML context, an explicit language markup is specified. Therefore, the LANGUAGE TAG (E0001) and other tag characters should not be used to mark a language in that context. The Unicode Consortium and the W3C have co-written a technical report: Unicode in XML and other Markup Languages (UTR#20), available from the Unicode web site (<http://www.unicode.org/reports/>), which describes these issues in detail.

The TAGS block contains 97 dedicated tag characters consisting of a clone of the BASIC LATIN graphic characters (names formed by prefixing these BASIC LATIN names with the word 'TAG', code points from E0020 to E007E), as well as a language tag identification character: LANGUAGE TAG (E0001) and a cancel tag character: CANCEL TAG (E007F).

The tag identification character is used as a mechanism for identifying tags of different types. This enables multiple types of tags to coexist amicably embedded in plain text and solves the problem of delimitation if a tag is concatenated directly onto another tag. Although only one type of tag is currently specified, namely the language tag, the encoding of other tag identification characters in the future would allow for distinct types to be used.

F.7.1 Syntax for embedding tag characters

In order to embed any ASCII-derived tag in plain text, the tag is simply spelled out with the tag characters, prefixed with the relevant tag identification character. The resultant string is embedded directly in the text.

No termination character is required for a tag. A tag terminates either when the first non Special Purpose Plane character is encountered, or when the next tag identification character is encountered.

Tag arguments can only be encoded using tag characters. No other characters are valid for expressing the tag arguments.

F.7.2 Tag scope and nesting

The value of a tag continues from the point the tag is embedded in text until

- either the end of the cc-data-element is reached,
- or the tag is explicitly cancelled by the CANCEL TAG character.

Tags of the same type cannot be nested. The appearance of a new embedded language tag, for example after text which was already language-tagged, simply changes the tagged value for subsequent text to that specified in the new tag.

F.7.3 Cancelling tag values

The CANCEL TAG character is provided to allow the specific canceling of a tag value. For example to cancel a language tag, the LANGUAGE TAG must precede the CANCEL TAG character.

The usage of the CANCEL TAG character without a prefixed tag identification character cancels any tag value that may be defined.

The main function of the character is to make possible such operations as blind concatenation of strings in a tagged context without the propagation of inappropriate tag values across the string boundaries.

F.7.4 Language tags

Language tags are of general interest and may have a high degree of interoperability for protocol usage. For example, to embed a language tag for Japanese, the tag characters would be used as follows:

E0001 E006A E0061

The first value is the coded value of the LANGUAGE TAG character, the second corresponds to the TAG LATIN SMALL LETTER J, and the third corresponds to the TAG LATIN SMALL LETTER A. The sequence 'ja' corresponds to the 2-letter code representing the Japanese language in ISO 639:1988.

Annex G
(informative)

Alphabetically sorted list of character names

The alphabetically sorted list of character names is provided in machine-readable format that is accessible as a link to this document. The content linked to is a plain text file, using ISO/IEC 646-IRV characters with LINE FEED as end of line mark, that specifies, after a 4-lines header, all the character names from ISO/IEC 10646 except Hangul syllables and CJK ideographs (these are characters from blocks:

HANGUL SYLLABLES,
CJK UNIFIED IDEOGRAPHS,
CJK UNIFIED IDEOGRAPHS EXTENSION A,
CJK UNIFIED IDEOGRAPHS EXTENSION B,
CJK UNIFIED IDEOGRAPHS EXTENSION C,
CJK UNIFIED IDEOGRAPHS EXTENSION D,
CJK COMPATIBILITY IDEOGRAPHS, and
CJK COMPATIBILITY IDEOGRAPHS SUPPLEMENT).

The format of the file, after the header, is as follows:

01-05 octet: UCS-4 five-digit abbreviated form,

06 octet: TAB character,

07-end of line: character name.

[Click on this highlighted text to access the reference file.](#)

NOTE 1 – The content is also available as a separate viewable file in the same file directory as this document. The file is named: "Allnames.txt".

NOTE 2 – The referenced files are only available to users who obtain their copy of the standard in a machine-readable format. However, the file format makes them printable.

Annex H
(informative)
The use of “signatures” to identify UCS

NOTE – Integrated in main body text, see 10.

Annex I (informative) Ideographic description characters

An Ideographic Description Character (IDC) is a graphic character, which is used with a sequence of other graphic characters to form an Ideographic Description Sequence (IDS). Such a sequence may be used to describe an ideographic character which is not specified within this International Standard.

The IDS describes the ideograph in the abstract form. It is not interpreted as a composed character and does not imply any specific form of rendering.

NOTE – An IDS is not a character and therefore is not a member of the repertoire of ISO/IEC 10646.

I.1.1 Syntax of an ideographic description sequence

An IDS consists of an IDC followed by a fixed number of Description Components (DC). A DC may be any one of the following:

- a coded ideograph
- a coded radical
- another IDS

NOTE 1 – The above description implies that any IDS may be nested within another IDS.

Each IDC has four properties as summarized in table I.1 below;

- the number of DCs used in the IDS that commences with that IDC,
- the definition of its acronym,
- the syntax of the corresponding IDS,
- the relative positions of the DCs in the visual representation of the ideograph that is being described in its abstract form.

The syntax of the IDS introduced by each IDC is indicated in the “IDS Acronym and Syntax” column of the table by the abbreviated name of the IDC (e.g. IDC-LTR) followed by the corresponding number of DCs, i.e. (D₁ D₂) or (D₁ D₂ D₃).

NOTE 2 – An IDS is restricted to no more than 16 characters in length. Also no more than six ideographs and/or radicals may occur between any two instances of an IDC character within an IDS.

I.1.2 Individual definitions of the ideographic description characters

IDEOGRAPHIC DESCRIPTION CHARACTER LEFT TO RIGHT (2FF0): The IDS introduced by this character describes the abstract form of the ideograph with D₁ on the left and D₂ on the right.

IDEOGRAPHIC DESCRIPTION CHARACTER ABOVE TO BELOW (2FF1): The IDS introduced by this character describes the abstract form of the ideograph with D₁ above D₂.

IDEOGRAPHIC DESCRIPTION CHARACTER LEFT TO MIDDLE AND RIGHT (2FF2): The IDS introduced by this character describes the abstract form of the ideograph with D₁ on the left of D₂, and D₂ on the left of D₃.

IDEOGRAPHIC DESCRIPTION CHARACTER ABOVE TO MIDDLE AND BELOW (2FF3): The IDS introduced by this character describes the abstract form of the ideograph with D₁ above D₂, and D₂ above D₃.

IDEOGRAPHIC DESCRIPTION CHARACTER FULL SURROUND (2FF4): The IDS introduced by this character describes the abstract form of the ideograph with D₁ surrounding D₂.

IDEOGRAPHIC DESCRIPTION CHARACTER SURROUND FROM ABOVE (2FF5): The IDS introduced by this character describes the abstract form of the ideograph with D_1 above D_2 , and surrounding D_2 on both sides.

IDEOGRAPHIC DESCRIPTION CHARACTER SURROUND FROM BELOW (2FF6): The IDS introduced by this character describes the abstract form of the ideograph with D_1 below D_2 , and surrounding D_2 on both sides.

IDEOGRAPHIC DESCRIPTION CHARACTER SURROUND FROM LEFT (2FF7): The IDS introduced by this character describes the abstract form of the ideograph with D_1 on the left of D_2 , and surrounding D_2 above and below.

IDEOGRAPHIC DESCRIPTION CHARACTER SURROUND FROM UPPER LEFT (2FF8): The IDS introduced by this character describes the abstract form of the ideograph with D_1 at the top left corner of D_2 , and partly surrounding D_2 above and to the left.

IDEOGRAPHIC DESCRIPTION CHARACTER SURROUND FROM UPPER RIGHT (2FF9): The IDS introduced by this character describes the abstract form of the ideograph with D_1 at the top right corner of D_2 , and partly surrounding D_2 above and to the right.

IDEOGRAPHIC DESCRIPTION CHARACTER SURROUND FROM LOWER LEFT (2FFA): The IDS introduced by this character describes the abstract form of the ideograph with D_1 at the bottom left corner of D_2 , and partly surrounding D_2 below and to the left.

IDEOGRAPHIC DESCRIPTION CHARACTER OVERLAID (2FFB): The IDS introduced by this character describes the abstract form of the ideograph with D_1 and D_2 overlaying each other.

Table I.1: Properties of ideographic description characters

Character Name: IDEOGRAPHIC DESCRIPTION CHARACTER ...	no. of DCs	IDS Acronym and Syntax	Relative posi- tions of DCs	Example of IDS	IDS example represents:
LEFT TO RIGHT	2	IDC-LTR D ₁ D ₂			母
ABOVE TO BELOW	2	IDC-ATB D ₁ D ₂			天
LEFT TO MIDDLE AND RIGHT	3	IDC-LMR D ₁ D ₂ D ₃			言
ABOVE TO MIDDLE AND BELOW	3	IDC-AMB D ₁ D ₂ D ₃			从
FULL SURROUND	2	IDC-FSD D ₁ D ₂			莫
SURROUND FROM ABOVE	2	IDC-SAV D ₁ D ₂			門
SURROUND FROM BELOW	2	IDC-SBL D ₁ D ₂			山
SURROUND FROM LEFT	2	IDC-SLT D ₁ D ₂			虎
SURROUND FROM UPPER LEFT	2	IDC-SUL D ₁ D ₂			广
SURROUND FROM UPPER RIGHT	2	IDC-SUR D ₁ D ₂			去
SURROUND FROM LOWER LEFT	2	IDC-SLL D ₁ D ₂			交
OVERLAID	2	IDC-OVL D ₁ D ₂			从

* NOTE – D₁ and D₂ overlap each other. This diagram does not imply that D₁ is on the top left corner and D₂ is on the bottom right corner.

Annex J
(informative)

Recommendation for combined receiving/originating devices with internal storage

This annex is applicable to a widely-used class of devices that can store received CC-data elements for subsequent retransmission.

This recommendation is intended to ensure that loss of information is minimized between the receipt of a CC-data-element and its retransmission.

A device of this class includes a receiving device component and an originating device component as in 2.3, and can also store received CC-data-elements for retransmission, with or without modification by the actions of the user on the corresponding characters represented within it. Within this class of device, two distinct types are identified here, as follows.

- 1) **Receiving device with full retransmission capability.** The originating device component will retransmit the coded representations of any received characters, including those that are outside the identified subset of the receiving device component, without change to their coded representation, unless modified by the user.
- 2) **Receiving device with subset retransmission capability.** The originating device component can retransmit only the coded representations of the characters of the subset adopted by the receiving device component.

Annex K
(informative)

Notations of octet value representations

Representation of octet values in ISO/IEC 10646 except in clause 12 is different from other character coding standards such as ISO/IEC 2022, ISO/IEC 6429 and ISO 8859. This annex clarifies the relationship between the two notations.

In ISO/IEC 10646, the notation used to express an octet value is z , where z is a hexadecimal number in the range 00 to FF. For example, the character ESCAPE (ESC) of ISO/IEC 2022 is represented in ISO/IEC 10646 by 1B.

In other character coding standards, the notation used to express an octet value is x/y , where x and y are two decimal numbers in the range 00 to 15. The correspondence between the notations of the form x/y and the octet value is as follows.

- x is the number represented by bit 8, bit 7, bit 6 and bit 5 where these bits are given the weights 8, 4, 2 and 1 respectively;
- y is the number represented by bit 4, bit 3, bit 2 and bit 1 where these bits are given the weights 8, 4, 2 and 1 respectively.

For example, the character ESC of ISO/IEC 2022 is represented by 01/11.

Thus ISO/IEC 2022 (and other character coding standards) octet value notation can be converted to ISO/IEC 10646 octet value notation by converting the value of x and y to hexadecimal notation. For example; 04/15 is equivalent to 4F.

Annex L
(informative)
Character naming guidelines

The clause 24 of this standard specifies rules for name formation and name uniqueness. These rules are used in other information technology coded character set standards such as ISO/IEC 646, ISO/IEC 6937, ISO/IEC 8859, and ISO/IEC 10367. This annex provides additional guidelines for the creation of these entity names.

These guidelines do not apply to the names of CJK Ideographs and Hangul syllables which are formed using rules specified in clause 24.5 and 24.6 respectively.

Guideline 1

The name of an entity wherever possible denotes its customary meaning (for example, the character name: PLUS SIGN or the block name: BENGALI).

Some entities, such as characters, may have a name describing shapes, not usage, (for example, the character name: UPWARDS ARROW).

The name on an entity is not intended to identify its properties or attributes, or to provide information on its linguistic characteristics, except as defined in guideline 4 below.

Guideline 2

An acronym consists of Latin capital letters A to Z and digits and is associated with a name.

Acronyms may be used in entity names where usage already exists and clarity requires it. For example, the names of control functions are coupled with an acronym.

EXAMPLES

<u>Name:</u>	<u>Acronym</u>
LOCKING-SHIFT TWO RIGHT	LS2R
SOFT HYPHEN	SHY
INTERNATIONAL PHONETIC ALPHABET	IPA

NOTE – In ISO/IEC 6429, the names of the modes have also been presented in the same way as control functions.

Guideline 3

Character names and named UCS Sequence Identifiers only include digits 0 to 9 if spelling out the name of the corresponding digit(s) would be inappropriate.

NOTE – As an example the name of the character at the code point value 201A is SINGLE LOW-9 QUOTATION MARK; the symbol for the digit 9 is included in this name to illustrate the shape of the character, and has no numerical significance.

Guideline 4

Character names and named UCS Sequence Identifiers are constructed from an appropriate set of the applicable terms of the following grid and ordered in the sequence of this grid. Exceptions are specified in guidelines 9 to 11. The words WITH and AND may be included for additional clarity when needed.

1	Script	5	Attribute
2	Case	6	Designation
3	Type	7	Mark(s)
4	Language	8	Qualifier

EXAMPLES OF SUCH TERMS

Script	Latin, Cyrillic, Arabic
Case	capital, small
Type	letter, ligature, digit
Language	Ukrainian
Attribute	final, sharp, subscript, vulgar
Designation	customary name, name of letter
Mark	acute, ogonek, ring above, diaeresis
Qualifier	sign, symbol

EXAMPLES OF NAMES

LATIN CAPITAL LETTER A WITH ACUTE

1 2 3 6 7

DIGIT FIVE

3 6

LEFT CURLY BRACKET

5 5 6

NOTE 1 – A ligature is a graphic symbol in which two or more other graphic symbols are imaged as a single graphic symbol.

For character names, where a character comprises a base letter with multiple marks, the sequence of those in the name is the order in which the marks are positioned relative to the base letter. The sequence may start with the marks above the letters taken in upwards sequence, and follow with the marks below the letters taken in downwards sequence, or the reverse (below/above).

For named UCS Sequence Identifiers, where the sequence comprises a base letter with multiple marks, the name describes the individual characters in the sequence in which they are encoded in the sequence.

EXAMPLES

Ō	LATIN CAPITAL LETTER O WITH CIRCUMFLEX AND DOT BELOW
Ç	LATIN CAPITAL LETTER C WITH CEDILLA AND ACUTE
Ų	LATIN CAPITAL LETTER U WITH OGONEK AND ACUTE

Guideline 5

The letters of the Latin script are represented within their name by their basic graphic symbols (A, B, C, etc.). The letters of all other scripts are represented by their transcription in the language of the first published International Standard.

EXAMPLES

K	LATIN CAPITAL LETTER K
Ю	CYRILLIC CAPITAL LETTER YU

Guideline 6

In principle when a character of a given script is used in more than one language, no language name is specified. Exceptions are tolerated where an ambiguity would otherwise result.

EXAMPLES

И	CYRILLIC CAPITAL LETTER I
І	CYRILLIC CAPITAL LETTER BYELORUSSIAN-UKRAINIAN I

Guideline 7

Letters that are elements of more than one script are considered different even if their shape is the same; they have different names.

EXAMPLES

А	LATIN CAPITAL LETTER A
Α	GREEK CAPITAL LETTER ALPHA
А	CYRILLIC CAPITAL LETTER A

Guideline 8

Where possible, named UCS Sequence Identifiers are constructed by appending the names of the constituent elements together while eliding duplicate elements. Should this process result in a name that al-

ready exists, the name is modified suitably to guarantee uniqueness among character names and named UCS Sequence Identifiers. The words WITH and AND may be included for additional clarity when needed.

Guideline 9

A character of one script used in isolation in another script, for example as a graphic symbol in relation with physical units of dimension, is considered as a character different from the character of its native script.

EXAMPLE

μ MICRO SIGN

Guideline 10

A number of characters have a traditional name consisting of one or two words. It is not intended to change this usage.

EXAMPLES

'	APOSTROPHE
:	COLON
@	COMMERCIAL AT
_	LOW LINE
~	TILDE

Guideline 11

In some cases, characters of a given script, often punctuation marks, are used in another script for a different usage. In these cases the customary name reflecting the most general use is given to the character. The customary name may be followed in the list of characters of a particular standard by the name in parentheses which this character has in the script specified by this particular standard.

EXAMPLE

~ UNDERTIE (Enotikon)

Annex N (informative)

External references to character repertoires

N.1 Methods of reference to character repertoires and their coding

Within programming languages and other methods for defining the syntax of data objects there is commonly a need to declare a specific character repertoire from among those that are specified in ISO/IEC 10646. There may also be a need to declare the corresponding coded representations applicable to that repertoire.

For any character repertoire that is in accordance with ISO/IEC 10646 a precise declaration of that repertoire should include the following parameters:

- identification of ISO/IEC 10646,
- the adopted subset of the repertoire, identified by one or more collection numbers,
- the CC-data-element content definition,
- the adopted encoding form (UTF-8, UTF-16, or UTF-32).

One of the methods now in common use for defining the syntax of data objects is Abstract Syntax Notation 1 (ASN.1) specified in ISO/IEC 8824. The corresponding coded representations are specified in ISO/IEC 8825. When this method is used the forms of the references to character repertoires and coding are as indicated in the following clauses.

N.2 Identification of ASN.1 character abstract syntaxes

The set of all character strings that can be formed from the characters of an identified repertoire in accordance with ISO/IEC 10646 is defined to be a “character abstract syntax” in the terminology of ISO/IEC 8824. For each such character abstract syntax, a corresponding object identifier value is defined to permit references to be made to that syntax when the ASN.1 notation is used.

ISO/IEC 8824-1 Annex B specifies the form of object identifier values for objects that are specified in an ISO standard. In such an object identifier the features and options of ISO/IEC 10646 are identified by means of numbers (arcs) which follow the arcs “10646” and “0” which identify the whole ISO/IEC 10646.

NOTE 1 – The arc (0) is required to complement the arcs (1) and (2) which represent respectively ISO/IEC 10646-1 and ISO/IEC 10646-2. These two arcs should not be used.

The first such arc following a 10646 arc identifies the CC-data-element content definition, and is referred as ‘level-3 (3)’.

NOTE 2 – This version of the standard specifies a single definition for CC-data-element content. That definition was formerly known as implementation level 3 in previous editions of this standard

The second such arc identifies the repertoire subset, and is either

- all (0), or
- collections (1).

Arc (0) identifies the entire collection of characters specified in ISO/IEC 10646. No further arc follows this arc.

NOTE 3 – This collection includes private planes, and is therefore not fully-defined. Its use without additional prior agreement is deprecated.

Arc (1) is followed by one or a sequence of further arcs, each of which is a collection number from Annex A, in ascending numerical order. This sequence identifies the subset consisting of the collections whose numbers appear in the sequence.

ISO/IEC 10646:2010 (E) Final Committee Draft (FCD)

NOTE 4 – As an example, the object identifier for the subset comprising the collections BASIC LATIN, LATIN-1 SUPPLEMENT, and MATHEMATICAL OPERATORS is:

{iso standard 10646 (0) level-3 (3) collections (1) 1 2 39}

ISO/IEC 8824 also specifies object descriptors corresponding to object identifier values. For an unrestricted repertoire, the corresponding object descriptor is as follows:

3 0 : "ISO 10646 level-3 unrestricted"

For a single collection with collection name "xxx".

3 1 : "ISO 10646 level-3 xxx"

For a repertoire comprising more than one collection, numbered m1, m2, etc.

3 1 : "ISO 10646 level-3 collections m1, m2, m3, .. "

NOTE 5 – All spaces are single spaces.

N.3 Identification of ASN.1 character transfer syntaxes

The coding method for character strings that can be formed from the characters in accordance with ISO/IEC 10646 is defined to be a "character transfer syntax" in the terminology of ISO/IEC 8824. For each such character transfer syntax, a corresponding object identifier value is defined to permit references to be made to that syntax when the ASN.1 notation is used.

In an object identifier in accordance with ISO/IEC 8824-1 Annex B, the coded representation form specified in ISO/IEC 10646 is identified by means of numbers (arcs) which follow the arcs "10646" and "0" which identify the whole ISO/IEC 10646.

The first such arc is

transfer-syntaxes (0).

The second such arc identifies the encoding form and is either

four-octet-form (4) for the UTF-32 encoding form, or
utf16-form (5) for the UTF-16 encoding form, or
utf8-form (8) for the UTF-8 encoding form.

NOTE 1 – As an example, the object identifier for the UTF-32 encoding form is:

{iso standard 10646 (0) transfer-syntaxes (0) four-octet-form (4)}

The following object identifier is also valid but deprecated:

{iso standard 10646 (1) transfer-syntaxes (0) four-octet-form (4)}

NOTE 2 – Previous versions of this standard supported a two-octet-BMP-form (2) arc which is now deprecated.

The corresponding object descriptors are:

"ISO 10646 form 4"

"ISO 10646 utf-16"

"ISO 10646 utf-8".

NOTE 3 – Previous versions of this standard supported the "ISO 10646 form 2" object descriptor which is now deprecated.

Annex P
(informative)
Additional information on CJK Unified Ideographs

This annex contains additional information on CJK Unified Ideographs.

NOTE – The first edition of this standard (ISO/IEC 10646:2003 and amendments 1 to 5) used this annex to provide additional information on all characters. This edition of the standard includes most of that information in the code charts. Because the code charts for CJK unified ideographs do not include any name list, the information about these characters is still included in this annex.

Each entry in this annex consists of the name of a character preceded by its code point, followed by the related additional information. Entries are arranged in ascending sequence of code point.

9FB9 CJK UNIFIED IDEOGRAPH-9FB9
9FBA CJK UNIFIED IDEOGRAPH-9FBA
9FBB CJK UNIFIED IDEOGRAPH-9FBB

These three characters are intended to represent a component at a specific position of a full ideograph. The ideographs representing the same structure without a preferred positional preference are encoded at 20509, 2099D, and 470C respectively.

Annex Q
(informative)
Code mapping table for Hangul syllables

NOTE – The information concerning mapping between Hangul syllables (and code points) that were specified in the first edition of ISO/IEC 10646-1 and their amended code points is available in previous editions of this standard.

Annex R
(informative)
Names of Hangul syllables

This annex provides the full name and additional information of Hangul syllables through a linked file:

The content linked to is a plain text file, using ISO/IEC 646-IRV characters with LINE FEED as end of line mark that specifies, after a 5-lines header, as all the Hangul syllables, each line specified as follows:

- 01-04 octet: code point in hexadecimal notation,
- 05 octet: SPACE character,
- 06 octet until end of line: Hangul syllable with the additional information between parenthesis.

[Click on this highlighted text to access the file containing the Hangul syllable names.](#)

NOTE – The content is also available as a separate viewable file in the same directory as this document. The file is named: "HangulSy.txt".

Annex S (informative)

Procedure for the unification and arrangement of CJK Ideographs

The graphic character collections of CJK unified ideographs in ISO/IEC 10646 are specified in clause 30. They are derived from many more ideographs which are found in various different national and regional standards for coded character sets (the "sources").

This annex describes how the ideographs in this standard are derived from the sources by applying a set of unification procedures. It also describes how the ideographs in this standard are arranged in the sequence of consecutive code points to which they are assigned.

The source references for CJK unified ideographs are specified in clause 23.

Within the context of ISO/IEC 10646 a unification process is applied to the ideographic characters taken from the codes in the source groups. In this process, single ideographs from two or more of the source groups are associated together, and a single code point is assigned to them in this standard. The associations are made according to a set of procedures that are described below. Ideographs that are thus associated are described here as "unified".

NOTE – The unification process does not apply to the following collections of ideographic characters:

CJK RADICALS SUPPLEMENT (2E80 - 2EFF)

KANGXI RADICALS (2F00 - 2FDF)

CJK COMPATIBILITY IDEOGRAPHS (F900 - FAFF with the exception of FA0E, FA0F, FA11, FA13, FA14, FA1F, FA21, FA23, FA24, FA27, FA28 and FA29)

CJK COMPATIBILITY IDEOGRAPHS SUPPLEMENT (2F800-2FA1F).

S.1 Unification procedure

S.1.1 Scope of unification

Ideographs that are unrelated in historical derivation (non-cognate characters) have not been unified.

EXAMPLE

士, 土

NOTE – The difference of shape between the two ideographs in the above example is in the length of the lower horizontal line. This is considered an actual difference of shape. Furthermore these ideographs have different meanings. The meaning of the first is "Soldier" and of the second is "Soil or Earth".

An association between ideographs from different sources is made here if their shapes are sufficiently similar, according to the following system of classification.

S.1.2 Two level classification

A two-level system of classification is used to differentiate (a) between abstract shapes and (b) between actual shapes determined by particular typefaces. Variant forms of an ideograph, which can not be unified, are identified based on the difference between their abstract shapes.

S.1.3 Procedure

A unification procedure is used to determine whether two ideographs have the same abstract shape or different ones. The unification procedure has two stages, applied in the following order:

- a) Analysis of component structure;
- b) Analysis of component features;

S.1.3.1 Analysis of component structure

In the first stage of the procedure the component structure of each ideograph is examined. A component of an ideograph is a geometrical combination of primitive elements. Alternative ideographs can be configured from the same set of components. Components can be combined to create a new component with a more complicated structure. An ideograph, therefore, can be defined as a component tree, where the top node is the ideograph itself, and the bottom nodes are the primitive elements. This is shown in Figure S.1.

Figure S.1 - Component structure

S.1.3.2 Analysis of component features

In the second stage of the procedure, the components located at corresponding nodes of two ideographs are compared, starting from the top level, as shown in Figure S.2.

Figure S.2 - The most superior node of a component

The following features of each ideograph to be compared are examined:

- the number of components,
- the relative position of the components in each complete ideograph,
- the structure of corresponding components.

If one or more of the features a) to c) above are different between the ideographs in the comparison, the ideographs are considered to have different abstract shapes and are therefore not unified.

If all of the features a) to c) above are the same between the ideographs, the ideographs are considered to have the same abstract shape and are therefore unified.

S.1.4 Examples of differences of abstract shapes

To illustrate rules derived from a) to c) in S.1.3.2, some typical examples of ideographs that are not unified, owing to differences of abstract shapes, are shown below.

S.1.4.1 Different number of components

The examples below illustrate rule a) since the two ideographs in each pair have different numbers of components.

崖•厓, 肱•肱, 降•夆

S.1.4.2 Different relative positions of components

The examples below illustrate rule b). Although the two ideographs in each pair have the same number of components, the relative positions of the components are different.

峰•峯, 荊•荆

When the ideographs consists of two horizontally aligned components, a difference of the last stroke of the left-hand ideograph going beneath the right-hand component should not warrant separate encoding, as in the case of the source glyphs for U+34F3:

G T

匙•匙

S.1.4.3 Different structure of a corresponding component

The examples below illustrate rule c). The structure of one (or more) corresponding components within the two ideographs in each pair is different.

扌•扌, 策•策, 𠂇•𠂇, 圣•圣, 𠂇•𠂇, 区•區, 夾•夾,
 單•單, 萑•萑, 𠂇•𠂇, 贊•贊, 襄•襄, 載•載, 間•間,
 朶•朶, 雋•雋, 恒•恆, 奂•奂, 从•从, 秦•秦, 𩇛•𩇛

S.1.5 Differences of actual shapes

To illustrate the classification described in S.1.2, some typical examples of ideographs that are unified are shown below. The two or three ideographs in each group below have different actual shapes, but they are considered to have the same abstract shape, and are therefore unified.

𠂇•𠂇•𠂇, 示•示•示, 艮•艮•艮, 食•食•食, 黃•黃, 盥•盥, 曷•曷,
 包•包, 青•青, 每•每, 册•册, 爭•爭, 𠂇•𠂇•𠂇, 𠂇•𠂇,
 步•步, 者•者, 臭•臭, 并•并, 骨•骨, 呂•呂, 直•直,
 𠂇•𠂇, 吳•吳•吳, 眞•眞•眞, 爲•爲, 單•單, 曾•曾•曾, 成•成,
 專•專, 內•內, 晉•晉, 龜•龜, 𠂇•𠂇

The differences are further classified according to the following examples.

a) Differences in rotated strokes/dots

半•半, 勺•勺, 羽•羽, 𠂇•𠂇, 兼•兼, 益•益

b) Differences in overshoot at the stroke initiation and/or termination

身•身, 雪•雪, 拐•拐, 不•不, 非•非, 周•周

c) Differences in contact of strokes

奧•奧, 西•西, 查•查

d) Differences in protrusion at the folded corner of strokes

巨•巨

e) Differences in bent strokes

册•册

f) Differences in folding back at the stroke termination

佘•佘

g) Differences in accent at the stroke initiation

父•父, 丈•丈

h) Differences in "rooftop" modification

八•八, 穴•穴

i) Addition or omission of a minor stroke

辶•辶, 步•步, 者•者, 臭•臭, 專•專, 爲•為

j) Combinations of the above differences

刃•刃•刃

k) Miscellaneous

晉•晋, 盥•盥, 骨•骨

These differences in actual shapes of a unified ideograph are presented in the corresponding source columns for each code point entry in the code charts in clause 30 of this International Standard.

S.1.6 Source separation rule

To preserve data integrity through multiple stages of code conversion (commonly known as “round-trip integrity”), any ideographs that are separately encoded in any one of the source standards listed below have not been unified.

G-source: GB2312-80, GB12345-90, GB7589-87*, GB7590-87*, GB8565-88*,
General Purpose Hanzi List for Modern Chinese Language*
T-source: TCA-CNS 11643-1986/1st plane, TCA-CNS 11643-1986/2nd plane,
TCA-CNS 11643-1986/14th plane*
J-source: JIS X 0208-1990, JIS X 0212-1990
K-source: KS C 5601-1989, KS C 5657-1991

NOTE – A “*” after the reference number of a standard indicates that some of the ideographs included in that standard are not introduced into the unified collection.

However, some ideographs encoded in two standards belonging to the same source group (e.g. GB2312-80 and GB12345-90) have been unified during the process of collecting ideographs from the source group.

The source separation rule described in this clause only applies to the CJK UNIFIED IDEOGRAPHS block specified in the Basic Multilingual Plane. ㄣ

NOTE – CJK Compatibility Ideographs are created following a rule very similar to the source separation rule. However, the end result is the combination of a single CJK Unified Ideograph and one or several CJK Compatibility Ideographs. When the source separation rule is applied, all ‘similar’ source CJK Ideographs result in separate CJK Unified Ideographs.

S.2 Arrangement procedure

S.2.1 Scope of arrangement

The arrangement of the CJK UNIFIED IDEOGRAPHS in the code charts of clause 30 of this International Standard is based on the filing order of ideographs in the following dictionaries.

Priority	Dictionary	Edition
1	Kangxi Dictionary 康熙字典	Beijing 7 th edition
2	Daikanwa Jiten 大漢和辭典	9 th edition
3	Hanyu Dazidian 漢語大字典	1 st edition
4	Daejaweon 大字源	1 st edition

The dictionaries are used according to the priority order given in the table above. Priority 1 is highest. If an ideograph is found in one dictionary, the dictionaries of lower priority are not examined.

S.2.2 Procedure

S.2.2.1 Ideographs found in the dictionaries

- If an ideograph is found in the Kangxi Dictionary, it is positioned in the code chart in accordance with the Kangxi Dictionary order.
- If an ideograph is not found in the Kangxi Dictionary but is found in the Daikanwa Jiten, it is given a position at the end of the radical-stroke group under which is indexed the nearest preceding Daikanwa Jiten character that also appears in the Kangxi dictionary.
- If an ideograph is found in neither the Kangxi nor the Daikanwa, the Hanyu Dazidian and the Daejaweon dictionaries are referred to with a similar procedure.

S.2.2.2 Ideographs not found in the dictionaries

If an ideograph is not found in any of the four dictionaries, it is given a position at the end of the radical-stroke group (after the characters that are present in the dictionaries) and it is indexed under the same radical-stroke count.

S.3 Source code separation examples

The pairs (or triplets) of ideographs shown below are exceptions to the unification rules described in S.1. They are not unified because of the source separation rule described in S.1.6.

NOTE – The particular source group (or groups) that causes the source separation rule to apply is indicated by the letter (G, J, K, or T) that appears to the right of each pair (or triplet) of ideographs. The source groups that correspond to these letters are identified at the beginning of this annex.

S.4 Non-unification examples

In accordance with the unification procedures described in S.1 the pairs (or triplets) of ideographs shown below are not unified. The reason for non-unification is indicated by the reference which appears to the right of each pair (or triplet). For “non-cognate” see S.1.1.

NOTE – The reason for non-unification in these examples is different from the source separation rule described in clause S.1.6.

Annex T
(informative)
Language tagging using Tag Characters

NOTE – Moved to F.7.

Annex U
(informative)
Characters in identifiers

A common task facing an implementer of UCS is the provision of a parsing and/or lexing engine for identifiers. Each programming language standard has its own identifier syntax; different programming languages have different conventions for the use of certain characters from the ASCII (ISO 646-IRV) range (\$, @, #, _) in identifiers. Questions as to which characters to use for syntactic purposes versus which to be allowed in identifiers, whether case-pairing should be included, normalization should be performed, and other factors enter into the picture when defining the set of permitted characters for a given identification purpose.

The Unicode Consortium publishes a document "UAX 31 – Identifier and Pattern Syntax" to assist in the standard treatment of identifiers in UCS character-based parsers. Those specifications are recommended for determining the list of UCS characters suitable for use in identifiers. The document is available at <http://www.unicode.org/reports/tr31/>.
