Title:	Basic components for Planes 1 & 2 of CNS 11643
Source:	TCA
Status:	Input to IRG
Action:	To be discuss
Distribution:	IRG Members and Ideographic Experts
Attached files:	table_of_basic_components(TCA).pdf
No. of pages:	5
Medium:	Electronic

The basic components for a set of ideographs are always dependent of the decomposition rules applying to those ideographs, i.e., different decomposition rules may cause different basic components. Before we are working on IDS, the decomposition rules and the set of basic components corresponding to those rules must be ready. The following is the English translation of CNS 11643-2 which specifies the decomposition rules and the basic components (see the attached file "[IRGN1133A_table_of_basic_components\(TCA\).pdf](#)") for the Chinese characters in the planes 1 & 2 of CNS 11643 last year. Based on CNS 11643-2, CMEX now is working on the structural attributes (similar to IDS) for the Chinese characters in Planes 1 & 2.

Basic Components for Chinese Characters

1. Scope of Application
This Standard sets out basic components for Chinese characters for use in Chinese document processing, character analysis, character structure description, character combination, and data exchange.
2. Definitions
 - (1) Grapheme: structural forms of characters. Chinese characters are formed by single or multiple strokes linked in specific ways and joined in set relative positions.
 - (2) Stroke: the minimum unit forming Chinese characters.
 - (3) Stroke Feature: concrete shapes of strokes, which is mainly characterized by direction of writing and shapes.
 - (4) Stroke sequence: stroke or stroke feature sequence arranged in order by constituted strokes of Chinese characters based on the sequence of writing.
 - (5) Stroke Count: the number formed by strokes or stroke features in the stroke sequence.
 - (6) Component: character unit constituted by stroke(s), which has the function of forming Chinese characters.

Remark: Chinese characters are formed by one or more components; ex: 木, 心, 巾, 彡, are all components that form Chinese characters.
 - (7) Prime Component: the main form or way of writing of component.

Remark: Ex: 土, 糸, 金 are prime components.

- (8) Subordinate Component: minor variations in grapheme or way of writing, or when the primary component is the radical of a character, its variable grapheme in the side radical is the subordinate component of the primary component.

Remark: Ex: 𠂔 is the subordinate component of 刀; 土 is the subordinate component of 土, 彳 is the subordinate component of 水, 纟 is the subordinate component of 糸, 钅 is the subordinate component of 金.

- (9) Character Formation Component: the component itself can be a Chinese character independently.

Remark: Ex: 另, 唱, 回 share the same component “口”, and 何, 哥, 奇 share the component “可”.

- (10) Character non-formation component: the component itself can not be a Chinese character independently.

Remark: Ex: Component of characters such as 同, 筒, 炯 is 冂, and component of characters 疾, 嫉, 痛 is 疒. These two components are not independent Chinese characters.

- (11) Basic Component: Components not formed by other even smaller components. They are also called the simple components. Since they are the final layer in Chinese character structure analysis, they are also called the last level components.

Remark: Ex: Components forming the character 男 are 田 and 力, and components forming the character 江 are 氵 and 工. All four of them are basic components.

- (12) Compound components: components formed by two or more basic components.

Remark: Ex: one of the components of 廂, 霜, 湘 is 相, and 相 is constituted by two basic components 木 and 目. The common component of 部, 菩, 賠 is 音, which is constituted by two basic components, 立 and 口.

3. Conformity

To comply with this standard when analyzing grapheme or component structure of a Chinese character, the analysis result must conform to the following principles:

- (1) Analyze a character to its basic component(s) according to the analysis principles stated in section 4.
- (2) Analyzed components may not exceed the components listed in section 5.

4. Analysis principles for Chinese character basic components

Chinese characters are constituted by one or more components; therefore, components of characters can be analyzed. If an analyzed component is a compound component, further analysis can be conducted, until each component is disassembled to the basic component (as shown in diagram 1). In Diagram 1, 謝 is a form-sound character; Therefore, it can be divided first into two parts - radical components (form radical) “言” and sound component (sound radical) “射”. “言” is already a basic component, but “射” is still a compound component. Therefore, “射” can be further analyzed into “身” and “寸”, and both of them are now basic components.

Remark: 謝 and 射 are pronounced the same in Minnan language.

Diagram 1 Example of Chinese Character Component Analysis

Principles for Chinese basic component analysis are as the following:

General rules:

- (1) Standard graphemes published by the Ministry of Education are adopted.
- (2) Component analysis is based on the actual way of writing; therefore, it is not limited by the origin of character formation.

Remark: Ex: The character 邱 has the components “丘” and “阝” (radical 邑), and character 阱 can be analyzed into components – “阝” (radical “阜”) and “井”.

- (3) Analysis of components is to be based on the principle of actual writing. If the component is a variable radical, the variable radical should be used.

Remark: Ex: “辶” and “辵” are both variables and should be based on. Ex: “土” when used as a left component is written as “土”, “王” as “玉”, “金” as a left component as “钅”, and “木” as a left component as “木”. Moreover, “比” has a left radical “匕” and a right radical “匕”; both writing styles should be adopted.

Analyzable Components

- (4) Components separated.

Remark: Ex; Chinese character “明” can be analyzed into “日” and “月”, and “札” into “木” and “乚”.

- (5) Components linked. Components connected by very few strokes that do not affect the structure and stroke count of the character.

Remark: 1. Chinese character “名” can be divided into “夕” and “口” (linked) and character “孝” can be separated into “耂” and “子” (linked).

2. Ex: “幾” can be separated into “幺”, “幺”, “戈”, and “人” (“人” hangs on the component “戈”).

- (6) Components for analysis are not restricted to traditional radicals. Any of the 214 radicals in Kangxi Dictionary that are further analyzable may be further analyzed.

Remark: Ex: the radical “鼻” can be further analyzed into “自”, “田”, and “丌”.

Components not analyzable

- (7) Components may not overlap; that is, overlapped components are not analyzable.

Remark: Ex: “果” may not be analyzed as “日” and “木” or “田” and “木”. “串” may not be analyzed as “口”, “口” and “丨”.

- (8) Multiple components that are too minor though not overlapped may not be divided.

Remark: “言” is not divided into “讠”, “一”, “一”, and “口”.

- (9) Characters that can be further divided, but the divided components have no character-forming functions are not divided.

Remark: Ex: “鬥” and “鬥” are not further divided into left and right parts.

Sub-principles

- (10) Graphemes conform to certain rules are analyzed based on the rules. Those can not be analyzed based on existing rules or the form and origination are in contradiction are analyzed without reference to the rules by their forms. When analyzing multiple component characters, the characters should be analyzed first by the layers of character combination based on existing rules. Until the components can not be further analyzed by existing rules and further analysis is still possible, the characters are then put under analysis without reference to existing rules.

Remark: 1. Ex: “分” can be analyzed into “八” and “刀” (based on origination, analysis with rules). “赤” can be analyzed into “土” and “小” (based on origination, analysis with rules).

2. Ex: “亦” can be divided into “亠” and “小” (not based on any rules, analysis without rules). “虎” can be divided into “虍” and “儿” (contradiction between form and origination, analysis without rules).

3. Ex: “東” can be analyzed as a stand-alone component (form and origination contradiction, no more analysis on form).

4. Ex: “給” can be analyzed into components “纟” and “合” (first layer, analysis with rules), and then the component “合” can be further separated into “厶” and “口” (second layer, analysis with rules). The component “厶” can then be further analyzed into “人” and “一” (third layer, analysis without rules).

5. Ex: “暴” can be directly separated into “日”, “艹”, “八”, and “水”.

- (11) Components varied in strokes or ratio due to different positioning in a Chinese character may be recognized as corresponding components listed in this document.

Remark: Ex: “土” (slanting 土), “金” (radical 金), “工” (recognized as radical 言), and “木” (radical 木)

5. Table of Basic Chinese Character Components

The Table of Basic Chinese Character Components is shown in appendix 1. The table is created through analysis, compilation, and statistical analysis of each of the First and Second layer characters of the total 13,051 characters listed in the CNS 11643 Chinese Standard Exchange Code. There are a total 517 characters/384 sets of basic components.

Remark: In the Table of Basic Chinese Character Component, each primary component constitutes one set. For those without subordinate components, their primary components make up a set independently. For those with one or more subordinate components, all of the components are grouped with their primary components into sets.

5.1 Component sequencing principles

- (1) Subordinate stroke features follow the primary stroke features.
- (2) Components are arranged in ascending order based on the primary stroke features; that is, those with less stroke counts are listed before those with more stroke counts.
- (3) Those with same stroke counts are arranged based on the stroke sequence number of the stroke sequence in ascending order. Stroke sequence numbers follow the standards in CNS 11643-1 Chinese Character Stroke Classification.

5.2 Component sequence number and set number

After sequencing, all basic components start from “1” and given numbers according to the order of each single basic component. Moreover, the primary component of each set is given a set number according to its order, and the set number for subordinate components is the same as its primary component.

Standards Adopted

CNS 11643 Chinese Standard Exchange Code
