Doc Type：Working Group Document<br>Title：Investigation of Tangut unification issues<br>Source：Andrew West and Viacheslav Zaytsev<br>Status：Individual Contribution<br>Action：For consideration by JTC1／SC2／WG2 and UTC<br>Date：2019－02－10

## 1．Summary

At the Ad hoc meeting on Tangut held at Yinchuan，China in August 2016，under the auspices of the Script Encoding Initiative，we were tasked with investigating seven possibly misunified Tangut ideographs identified by Profs．Jia Changye and Jing Yongshi，and were asked to report our findings and suggest a resolution to the issues（see WG2 N4736；L2／16－243）．This document details our investigation，and concludes that the seven Tangut ideographs in question should not have been unified because there are subtle but systematic glyph differences that distinguish the two readings and meanings of each of these encoded characters．We think that two other Tangut ideographs that are distinguished in some sources only should also be disunified，pending agreement of other Tangut experts．Our recommendations are summarized below，and the proposed disunifications of nine Tangut ideographs are listed in Table 1：
 18736 敟）should be disunified，and eight new Tangut ideographs encoded at 187F8．．187FE；
－Two Tangut ideographs（175F6 娏 and 17134 咬）are candidates for disunification，pending agreement with other Tangut experts．
－Five Tangut components（18843 久，1888C 久，1890A 多，18915 交，1893B 交）should be disunified，and five new components encoded at 18AFA．．18AFE；
－The Tangut data file should be expanded to include a new key which gives the radical number and total stroke count for all encoded Tangut ideographs listed in Jia and Jing＇s Table of Xixia Characters with Annotated Properties（西夏字符及属性标注表）or other document；
－A new Tangut font which reflects Jia and Jing＇s analysis of the structure of Tangut components and ideographs should be provided for the code charts．

This document does not formally propose any new characters for encoding，but is made available for discussion．If Tangut experts from China agree with the proposed disunifications we will submit a joint proposal for the new characters in due course．

## Table 1: Summary of Proposed Disunifications

| Code <br> Point | Current <br> Glyph | New <br> Glyph A | New <br> Glyph B | Notes |
| :--- | :--- | :--- | :--- | :--- |
| 17134 |  | Glyph A = L2008-3488: "pair" [twe] |  |  |
| $175 F 6$ |  | Glyph B = L2008-3489: "foolish" [ngia] |  |  |

We propose that for each row in the above table, Glyph A remains at the original code point, and Glyph B is assigned to a new code point.

## 2．Introduction

There are ten encoded Tangut ideographs which each explicitly unify two entries in Li Fanwen＇s 2008 Tangut－Chinese Dictionary（Xià－Hàn zìdiăn 夏漢字典）that have the same glyph shape but have different readings and meanings（see Table 2）．There are also a number of other encoded ideographs which unify two different entries in the 2008 dictionary，but those are insignificant glyph variants for the same semantic character，so are not relevant to this discussion．

Table 2：Tangut ideographs that unify two semantically－distinct entries in Tangut－Chinese Dictionary（Li Fanwen 2008）

| C／P | Glyph | Entry A | Entry B |
| :---: | :---: | :---: | :---: |
| 17134 | 悩 | $3488$ <br> ＂pair，couple＂ <br> ＊twe <br> Common character． | 3489 <br> ＂foolish，stupid，clumsy＂ <br> ＊gja <br> Uncommon character，normally in the word 瑷悛＊kjwi gja＂foolish＂． |
| 175 F 6 | 狵 | 1666 ＂fox＂ ＊nə Normally in the word 昽謎＊nə dźiə＂fox＂． | $\begin{aligned} & \hline 1667 \\ & \text { "tail, east" } \\ & *_{\text {ta }} \end{aligned}$ <br> Normally in the word 胧咙＊tji ta＂tail， east＂． |
| 17E08 | 形原 | $0406$ <br> ＂a transliteration＂ <br> ＊djwi | $0407$ <br> ＂to squeeze＂（lice to death） <br> ＊djwu |
| 17F0D | 後 | 3435 <br> ＂god，deity，divinity，supernatural being＂ <br> ＊үи <br> Rare character，normally only in the word 聄擾＊yu mo＂gods＂． | 3436 <br> ＂very close relative＂ <br> ＊sa <br> Rare character，normally only in the word 㰢条後＊sa njij＂very close relative＂ |
| 17F8A | 爻 | 2252 <br> ＂a kind of bird＂（cuckoo） <br> ＊bju <br> Rare character，normally only in the word 刘豩＊bju njij＂cuckoo＂． | 2253 <br> ＂warehouse＂ <br> ＊wjij <br> Rare character，normally only in the <br>  surname 怀弹＊wjij $\cdot 0$ ． |

Investigation of Tangut unification issues

| C／P | Glyph | Entry A | Entry B |
| :---: | :---: | :---: | :---: |
| 17FA5 | 㸚 | 3683 <br> ＂the day after tomorrow＂ <br> ＊sja <br> Common character，in the word婒绞＊sja djij＂day after tomorrow＂，used as a particle，or as a transcription character． | 3684 <br> ＂a kind of bird＂ <br> ＊śie <br> Rare character，normally only in the <br>  and 鿖㷋＊xjow śie＂kind of bird＂． |
| 18139 | 㸚 | 1317 <br> ＂to brush，to whisk＂ <br> ＊twe <br> Uncommon character． | 1318 <br> ＂to jump，to leap＂ <br> ＊${ }^{j} \mathrm{jij}$ <br> Uncommon character． |
| 18147 | 笎 | $1734$ <br> ＂a prefix representing no＂ ${ }^{*} \mathrm{tji}$ <br> Common character． | 1735 <br> ＂respectful＂ <br> ＊kwej <br> Uncommon character． |
| 184F1 | 豛炎 | 1106 <br> ＂swallow＂（bird） <br> ＊me <br> Uncommon character，normally only in the word 豞㸚＊me rjir ＂swallow＂． | 1107 <br> ＂heaven，emperor＂ <br> ＊ywo <br> Common character． |
| 18736 | 带爻 | 4456 <br> ＂wild goose＂ <br> ＊tha <br> Rare character，only in the word举缑＊tha xa＂wild goose＂＝ Chinese 大雁 dàyàn． | 4457 <br> ＂big，great，large＂ <br> ＊${ }^{j} \mathrm{ij}$ <br> Very common character． |

＊In the above table readings are as given in Li Fanwen＇s 2008 dictionary．Elsewhere in this document，M．V．Sofronov＇s readings in E．I．Kychanov＇s 2006 Tangut dictionary are used．

In the 2008 edition of Li Fanwen＇s dictionary，which was the primary source for the encoded set of Tangut ideographs，each pair of these ten entries are written with exactly the same glyph using a computer font designed for the dictionary by Prof．Jing Yongshi（a modified version of this font is also used for the Unicode and ISO／IEC 10646 code charts）．Other modern dictionaries and character lists that were used as sources for the encoding also do not graphically distinguish these pairs of characters（see Table 3）．In addition，Han Xiaomang＇s 2004 PhD dissertation on Tangut orthography provides only a single glyph form for each pair of semantically－distinguished characters．

＊In addition to the ten pairs of unified ideographs listed in Table 2，Table 3 also includes the pair of encoded ideographs 182F5 綎［mbọ］＂vulture＂and 180D6 笼［źạ］＂fountainhead＂which actually have the same left side component（交）in Tangut source texts and would have been unified if the left side of 180D6 㸚处 had not been misidentified as 受 in Li Fanwen＇s dictionary．

## Investigation of Tangut unification issues

As the sources used for encoding Tangut did not distinguish these characters at the graphic level， and following the principles of CJK encoding where graphically identical characters with multiple distinct readings and meanings are unified（e．g．樂 is encoded as a single character representing both＂joy＂［Mandarin lè；Japanese raku）and music＂［Mandarin yuè；Japanese gaku］），these ten pairs of Tangut ideographs were explicitly unified for encoding．

In December 2013，at the international meeting on encoding the Tangut script held in Beijing， China（see Deborah Anderson＇s summary report：WG2 N4516；L2／13－241），the unification of these characters was discussed，and although some experts were in favour of encoding them as separate characters，no－one stood up and stated that there were graphic differences which meant that they should not be unified．As a result，it was agreed by all participants to unify the pairs of characters listed in Table 2 （as summarised in bullet point 1.2 of the meeting report）．In the subsequent final proposal document submitted in January 2014 （WG2 N4522；L2／14－023），which was co－authored by Andrew West（UK），Michael Everson（Ireland），Han Xiaomang（China），Jia Changye（China），Jing Yongshi（China），and Viacheslav Zaytsev（Russia），nine pairs of homoglyph characters were explicitly unified（see §5．2．2 Homoglyphs）．

Prof．Arakawa Shintarō discussing 敟（18736）at the Beijing 2013 Tangut meeting

Note how the two meanings of the character 㪤 on the whiteboard are written the same

During the ISO balloting process，West，Zaytsev and Everson carried out extensive reviews of the Tangut repertoire，and pointed out a large number of glyph corrections where the glyph used in Li Fanwen＇s 2008 dictionary was incorrect or suboptimal（see WG2 N4588R2；L2／14－209R）． However，no experts raised any concerns about the unified homoglyphs during the ballot period．

Then in August 2016，just two months after the release of Unicode 9.0 which incorporated the Tangut script，West，Zaytsev and Everson attended a meeting on encoding Khitan scripts held at Yinchuan in China（see Deborah Anderson＇s summary report \＃1：WG2 N4736；L2／16－243）．Many of the Khitan experts were also Tangut experts，and so at the request of the Chinese experts，half a day of the meeting was also devoted to discussion of some issues with the encoded Tangut repertoire that Profs．Jing Yongshi and Jia Changye reported that they had recently discovered． Jing and Jia informed us that they had made important advances in the understanding and analysis of the structure，stroke order and stroke count of Tangut characters．They reported that there are subtle but significant differences in the way some Tangut components are written，with the result that the stroke counts provided in the ISO／IEC 10646 and Unicode Tangut data files are not ideal in many cases（this can be remedied by adding a new key for their preferred radical and stroke count data，whilst keeping the original kRSTUnicode key as this reflects the ordering of Tangut ideographs in the Tangut block）．Furthermore，they demonstrated to us that a few encoded components are systematically written in two slightly different ways（with differing stroke counts）in different sets of ideographs，and that this component glyph variation is semantic and not merely cosmetic．They therefore believe that a small number of encoded Tangut components should be disunified into two components with slightly different glyphs forms and differing stroke counts．

Jia and Jing provided us with a draft version of their Table of Xixia Characters with Annotated Properties 西夏字符及属性标注表（草稿）dated August 2016，which lists all Tangut ideographs （including numerous variant forms）by radical and stroke count（see Zhonghua ziku．．．2016）． Their document graphically distinguishes two separate components for each of the five encoded Tangut components listed in Table 4 below．

Table 4：Components disunified by Jia and Jing

| Code <br> Point | Unicode Component | Code Chart Glyph | Stroke Count | Disunified Component | Stroke Count |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 18843 | 068 | 又 | 3 | ג | 2 |
| 1888C | 141 | 人 | 4 | 久 | 3 |
| 1890A | 267 | 爻 | 5 | 爻 | 3 |
| 18915 | 278 | 交 | 5 | 交 | 4 |
| 1893B | 316 | フ | 5 | フ | 4 |

Currently，for all encoded components containing the element $\chi$ ，this element is written as three strokes，with a disjoint between the first and third stroke；but according to the analysis of Jing and Jia，in some components this element is written as three strokes，but in other components it is written as two strokes，with the first and third strokes written as single bent stroke．The stroke order of the components listed in Table 4 is illustrated in Table 5.

Table 5：Stroke order of potentially disunifiable components

| Code <br> Point | Unicode Comp． | Jia \＆Jing Radical | Stroke Count | $\begin{gathered} 1^{\text {st }} \\ \text { Stroke } \end{gathered}$ | $2^{\text {nd }}$ Stroke | 3rd <br> Stroke | $4^{\text {th }}$ Stroke | $5^{\text {th }}$ Stroke |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 18843 | 068 | 16 | 2 | $\langle$ | X |  |  |  |
|  |  | 45 | 3 | 1 | 乡 | 又 |  |  |
| 1888C | 141 | 51 | 3 | 1 | 久 | 人 |  |  |
|  |  | 107 | 4 | 1 | ノ | 乡 | 父 |  |
| 1890A | 267 | 52 | 3 | $<$ | 4 | 爻 |  |  |
|  |  | 201 | 5 | ， | リ | 久 | 冬 | 父 |
| 18915 | 278 | 121 | 4 | ＇ | $\perp$ | 广 | 交 |  |
|  |  | 211 | 5 | ＇ | － | ナ | 方 | 交 |
| 1893B | 316 | 137 | 4 | $\neg$ | コ | 군 | 少 |  |
|  |  | 238 | 5 | $\neg$ | コ | フ | 기 | フ |

There are a number of other encoded Tangut components that Jia and Jing analyse as having a single bent stroke rather than two disjoined strokes（e．g．they analyse Unicode Component 144 4 as having 3 strokes），but in these cases all ideographs with these components are written the same way，so there are no disunification issues，and there is no need to discuss them further in this document．

Seven of the ten pairs of Tangut ideographs listed in Table 2 incorporate either Component 267 （爷）or Component 316 （专），and it is Jing and Jia＇s contention that these seven pairs of characters can actually be distinguished graphically due to the difference in the way that components 267 and 316 are written in each character．Therefore，they suggest that the unification of these seven pairs of characters was a mistake，and the seven encoded characters should be disunified into two separate encoded characters．

Table 6：Example glyph forms for ideographs with Component 267

|  | Type A 爻 |  | Type $B$ 爻 |  |

In order to more clearly illustrate the distinctions in the graphic forms of these components， example ideographs for both forms of Component 267 （ $火$ ）and Component 316 （ $\frac{7}{x}$ ）are given in Table 6 and Table 7．For each component type，one ideograph has the component on the left side， and one ideograph has the component on the right side．For each ideograph，images of the characters from the two major works of Tangut lexicography，Sea of Writing（焲不市＝Wénhăi 文海 ［WH］）and Homophones（䄉笼＝Tóngyīn 同音［TY］）are shown．The five－stroke forms of Component 267 and Component 316 （with disjoined strokes）are referred to as Type A，whereas the three－stroke form of Component 267 and the joined four－stroke form of Component 316 （with joined strokes）are hereafter referred to as Type B．

In these examples the distinction between the Type A and Type B forms of these two components is very clear in the original Tangut texts，and the glyph forms are consistent in both the Sea of Writing and Homophones．For comparison，the corresponding glyphs in modern scholarly editions of the Sea of Writing and Homophones，as well as the Mojikyō font glyphs（used in Kychanov＇s 2006 Tangut dictionary）and Jing Yongshi＇s font glyphs（used in Li Fanwen＇s 2008 Tangut dictionary）are also shown．None of these modern editions or fonts show any distinction between the two component forms，and the components are normalized to the same glyph form． We do not know of any modern sources which do otherwise．

With hindsight the difference between the Type A and Type B forms of these two components is very distinct，and it now seems obvious to us that they are different components，but in over a hundred years of Tangutology，it seems that no－one has explicitly stated that these are separate components before Jia and Jing raised the issue in 2016．Scholars of the Tangut script have treated the differences between Types A and B as insignificant variations in handwriting， probably reflecting their assumptions that the construction of strokes in the Tangut script imitates the Han script where there are no similar examples of components that vary in this way．

It should be noted that this is not the first time that very similar Tangut components which can be easily mistaken for each other have been shown to be distinct and unrelated．Components 192 （苏）and 296 （㴹）were treated as the same component in the 1997 edition of Li Fanwen＇s dictionary and most other modern works of Tangut scholarship．Likewise，there used to be confusion among many Tangut scholars over the status of Components 031 （丰）， 086 （丰）and 170 （半）which were often considered to be variant ways of writing the same component．Prof． Jing Yongshi clarified that these five components were not interchangeable，and in the 2008 edition of Li Fanwen＇s dictionary they were correctly treated as separate components．The identification of glyph distinctions for Components 267 and 316 by Jing and Jia should be seen as a continuation of a long process of understanding Tangut orthography．

The consistent treatment of Component 267 and Component 316 in two different primary sources（Sea of Writing and Homophones）in the above examples is very suggestive that the two different components have been mistakenly unified by modern scholars．However，this is not conclusive evidence，and in order to test this theory we need to systematically analyse the forms of Component 267 and Component 316 in all characters including these components．

## Investigation of Tangut unification issues

At the 2016 meeting in Yinchuan Andrew West was given an action to investigate this issue and recommend a resolution:

West will gather evidence for 7 character forms currently unified in Unicode, but for which there may be a difference in how they are written. Based on the evidence, West will propose what to do (i.e., disunify the forms or use variation sequences with the variation captured in a font).
— WG2 N4736; L2/16-243
We present our analysis of the potentially misunified pairs of Tangut ideographs in the next section of this document. In addition to the seven pairs of characters raised by Jing and Jia, we also examine the three other pairs of unified ideographs shown in Table 2.

## 3．Analysis

## 3．1 Methodology

Tangut ideographs are not constructed from a component with a fixed semantic meaning（radical） and a component with a relatively fixed phonetic value，as is the case for the vast majority of Han ideographs．Rather，each Tangut ideograph is constructed from two or more components which are derived from other Tangut ideographs in an idiosyncratic and sometimes hard to understand way．In the typical case，one part of a Tangut ideograph is derived from another Tangut ideograph with a related meaning（the semantic parent），and the other part is derived from another Tangut ideograph with the same pronunciation（the phonetic parent）．For example，㟋 ＂dawn＂［we］is derived from the left side of 瓶＂to realize＂［we］（phonetic parent）and the right side of 権＂morning＂［sin］（semantic parent）．

Although derivation from a single semantic parent and a single phonetic parent is most prevalent， there are a variety of other types of derivation，such as multiple semantic parents which are synonyms（e．g．庭＂mouse＂is derived from the left side of 莚＂ground rat＂and the right side of 㬵 ＂mouse＂），multiple semantic parents which are descriptive（e．g．效＂silver＂is derived from the right of 般＂white＂and the bottom of 荊＂gold＂），and multiple phonetic parents indicating a fănqiè reading（e．g．the phonetic transcription character 狿［tśiwa］is derived from the top and left side

However，unlike the Han script，the derived components do not have an intrinsic semantic or phonetic value，as these depend upon the particular ideograph that the component is derived from，and any given component may be borrowed for either the semantic or phonetic value of the source ideograph．For example，the component $\frac{3}{}$ in 㟲＂to desire＂［tshi］is derived from the left
 ［ton］is derived from the right side of 教＂to get＂［ton］（phonetic parent），and the component 交 in䇝＂a surname＂$[\cdot o]$ is derived from the left side of 戗＂month＂$[\cdot o]$（phonetic parent）．

The Tangut dictionary Sea of Writing provides an explanation for the construction of each Tangut ideograph，listing the parent ideographs from which each component of the child ideograph derives from．This allows us to build up chains of related characters which share the same component，either as a semantic element or as a phonetic element（in many cases the derivation given in Sea of Writing is circular，but that does not matter for this exercise）．

We can state as a rule that the same component in a chain of related ideographs should be written with the same glyph form in the same position（there are some components that have different glyph forms depending upon whether the component is positioned on the left side，right side，or top of the ideograph）．Therefore if the five encoded components listed in Table 4 really do each represent two different components，we should find that for any given chain of Tangut ideographs related by one of these five components，all ideographs should share the same glyph form．If，on the other hand，chains of Tangut ideographs show a mixture of both glyph forms for
these five components，then that would indicate that the glyph variations are not semantically significant，and should not be reflected at the encoding level．

In order to test whether there is a semantic difference between the 3－stroke and 5－stroke glyph forms of Component 267，and between the 4 －stroke and 5 －stroke glyph forms of Component 316， we analysed the chaining relationships and glyph forms for all encoded Tangut ideographs that include either of these two components．We do not analyse the other three components given in Table 4 （Components 068，141，278）as there are no pairs of unified ideographs with these components．The results of this analysis are tabulated in the appendix（see Section 6.1 for Component 267，and Section 6.2 for Component 316）．

Chaining relationships is based on the character derivations given for head entries in Sea of Writing（printed edition），Precious Rimes of Sea of Writing（manuscript edition），and Combined Edition of Homophones and Sea of Writing（manuscript editions）．In some cases，where no head entry survives in any of these sources，we have postulated a probable derivation based on a combination of graphic，semantic or phonetic similarities．These unsourced derivations are given in square brackets．

For glyph comparison purposes we provide images of each character（where available）from xylographic editions of five major works of Tangut lexicography or phonetics that were printed during the Western Xia period：

- Sea of Writing（Wénhăi 文海）volumes I and III
- Homophones（Tóngyīn 同音）A edition（preface dated 1132）
- Homophones（Tóngyīn 同音）B edition（various exemplars）
- Mixed Characters（Zázi 雜字）（colophon dated 1187）
- Pearl in the Palm（Fān－Hàn héshí zhăngzhōngzhū 番漢合時掌中珠）（preface dated 1190）

In order to check whether the distinction between Type A and Type B glyph forms shown in the above sources are maintained throughout the Tangut corpus，in Section 6.3 we provide a sample of 36 characters with Component 267 and 28 characters with Component 316 from a range of different types of texts dating from the Western Xia，Yuan and Ming periods．
－Collected Writings of the Shining Speech of Three Generations（Sānshìshǔ míngyán jíwén 三世屬明言集文），a Western Xia Buddhist text printed using movable type
－Homonyms（Zéyào chángchuán tóngmíng zázi 擇要常傳同名雜字），a Western Xia xylographic edition of a linguistic text
－Proverbs（Yànyǔ 諺語），a Western Xia xylographic edition of a secular literary text（colophon dated 1187）
－Odes（Shī 詩），a Western Xia xylographic edition of a secular poetic text（colophons dated 1185－1187）

- Forest of Categories（Lèilín 類林），a Western Xia xylographic edition（colophon dated 1181）
- Newly Collected Grains of Gold Placed in the Palm Text（Xīnjí suijīn zhìzhăngwén 新集碎金置掌

文），a Western Xia hand－written text

## Investigation of Tangut unification issues

－Ming dynasty dhāraṇī pillar inscriptions at Baoding，dated 1502

## 3．2 Component 267

We analysed 307 encoded Tangut ideographs that incorporate Component 267 or other
 appendix（Section 6．1），and summarized in Table 8 （the five unified ideographs with two readings and meanings are highlighted in yellow）．We were able to identify 35 chains of graphically－related ideographs，ranging from just two ideographs up to fifty－four ideographs． There is a very clear division between chains of ideographs with Component 267 written with five strokes（Type A：父）and chains of ideographs with Component 267 written with three strokes（Type B：爻）． 16 chains（Groups 1－16）have Type A components，and 19 chains（Groups 19－37）have Type B components．There are 44 ideographs which are not assigned to a chain due to lack of evidence，of which 25 have Type A components（Groups 17－18），and 19 have Type B components（Group 38）．In total，about half of the ideographs analysed have Type A components and about half have Type B components．

Table 8：Summary of Component 267 groups

| Group | Count | Tangut ideographs | Type |
| :---: | :---: | :---: | :---: |
| 1 | 54 |  <br>  | A |
| 2 | 6 |  | A |
| 3 | 8 |  | A |
| 4 | 4 |  | A |
| 5 | 2 | 昽昽 | A |
| 6 | 2 |  | A |
| 7 | 7 |  | A |
| 8 | 5 |  | A |
| 9 | 8 |  | A |
| 10 | 9 |  | A |
| 11 | 5 |  | A |

Investigation of Tangut unification issues

| Group | Count | Tangut ideographs | Type |
| :---: | :---: | :---: | :---: |
| 12 | 4 |  | A |
| 13 | 17 |  | A |
| 14 | 2 | 龵龩 | A |
| 15 | 3 |  | A |
| 16 | 2 |  | A |
| 17 | 21 |  | A |
| 18 | 4 |  | A |
| 19 | 4 | 聄娣䍜鲨 | B |
| 20 | 12 |  | B |
| 21 | 21 |  | B |
| 22 | 9 |  | B |
| 23 | 2 | 屏数 | B |
| 24 | 2 | 勿碟碎 | B |
| 25 | 11 |  | B |
| 26 | 9 |  | B |
| 27 | 6 |  | B |
| 28 | 25 |  | B |
| 29 | 5 |  | B |
| 30 | 3 | 挽攻戦 | B |
| 31 | 2 | 紋㸚 | B |
| 32 | 3 |  | B |
| 33 | 2 | 媛皧 | B |
| 34 | 2 | 舷揪 | B |
| 35 | 2 |  | B |
| 36 | 2 |  | B |
| 37 | 3 |  | B |
| 38 | 19 |  | B |

With only a handful of exceptions，ideographs in the same chain are all written with the same form of Component 267 （i．e．either all Type A or all Type B）．Furthermore，the use of Type A or Type $B$ is generally consistent for the same ideograph across multiple texts．It is especially noticeable that all ideographs with meanings related to birds have Type A components（Groups 1－6，and Group 17），although Type A components are not restricted ideographs related to birds．

The only unambiguous example of a character not having the expected component type for the chain it belongs to is 1731C 微＂dew＂（Group 9），which has a Type B right side component in all sources，but Sea of Writing derives the right side component from 18324 㢢＂strip＂which has a Type A right side component．In this case，the derivation in Sea of Writing may be wrong or the parent character written incorrectly，because the derived character＂strip＂does not make sense as either a semantic or phonetic parent for＂dew＂（the left and middle components of＂dew＂ derive from 172FD 戬＂water＂and 18696 預＂moist＂respectively，which do make sense）．

The level of distinction between Type A and Type B components varies from character to character．The distinction is usually most obvious for characters with just two components side－ by－side，and is not always so clear where the component occurs in the middle of a character or the component is laterally compressed because the ideograph consists of three or more components side－by－side．In these situations the start point of a disjoined stroke may touch the endpoint of another stroke，with the result that there may only be a very subtle distinction between two component forms（Type A shows a narrowing of the strokes where they join， whereas Type B shows a thicker joint）．In particular，the top strokes of Type A glyphs often appears to be joined like the top strokes of Type B glyphs（see for example 交 and some other ideographs listed in Groups 10－12 of Section 6．1），but this is not consistent，and often varies for the same character depending on the source．For example，the form of 17 F 95 㤊＂swallow＂in Homophones Edition A shows the top strokes joined on the left component，whereas the same character in Homophones Edition B shows a clear disjoint between the top strokes of the left component：

It does not seem to us that there is a consistent and meaningful distinction in such cases，and we think that these differences should be considered as variant ways of writing the same component． The main distinguishing feature of Type A compared with Type B appears to be the disjoint of the bottom two strokes．

The distinction between Type A and Type B components also varies from source to source．The distinction is generally clearer in Sea of Writing and Homophones than in Mixed Characters and Pearl in the Palm．Looking at a wider range of Tangut texts，（see Section 6.3 ＂Evidence from Other Sources＂Table A），we can see that the distinction between Types A and B is clearly preserved in
most texts．For most characters listed in Section 6．3 Table A，the sources dating from the Western Xia period（both printed and manuscript）concur with Sea of Writing and Homophones with respect to usage of Type A versus Type B components，although there are some unexpected glyph forms．For example，in Proverbs 17FFC 梗 is written both with the expected Type A component and with the unexpected Type B component in different places．However，given that miswritten characters（e．g．with missing or additional strokes）are quite common in all Tangut texts，it is not at all surprising that scribes would occasionally write a character with the wrong component shape．The post－Western Xia sources are much less consistent，and in particular the Yuan dynasty edition of the Avataṃsaka Sütra writes most Type B components as Type A．
 incorporate Unicode Component 267 （炎），and each have two distinct meanings and readings． For these five characters，one meaning of each is related to birds，and one meaning is unrelated to birds（it is not immediately obvious that 17F0D 談＂god＂is related to birds，but in the Tangut text Synonyms this character is included in a synonym group with other characters meaning ＂vulture＂）．Reflecting the general observation for Component 267，all five bird－related meanings are written with a Type A component，whereas the five other meanings are all written with a Type B component．A comparison of the glyph forms in Homophones［TY］for each of these pairs， showing this clear distinction，is given in Table 9．In addition，the pair of encoded ideographs 182F5 处［mbọ］＂vulture＂and 180D6 效［źạ］＂fountainhead＂actually have the same left side component（ $\frac{4}{x}$ ），and differ by the glyph type of the middle component．

Table 9：Tangut ideographs which differ by Component 267 glyph type

## 3．3 Component 316

We analysed 254 encoded Tangut ideographs that incorporate Component 316 or other supercomponents of Component 316 such as 美美要。These are listed in 37 groups in the appendix（Section 6．2），and summarized in Table 10 below（the two unified ideographs with two readings and meanings are highlighted in yellow）．We were able to identify 35 chains of graphically－related ideographs，ranging from just two ideographs up to thirty－six ideographs．

## Investigation of Tangut unification issues

There is a very clear division between chains of ideographs with Component 316 written with five strokes（Type A：交）and chains of ideographs with Component 316 written with three strokes（Type B：专）． 18 chains（Groups 1－18）have Type A components，and 16 chains（Groups 21－36）have Type B components．There are 20 ideographs which are not assigned to a chain due to lack of evidence，of which 3 have Type A components（Group 20），and 20 have Type B components（Group 37）．In addition there are two ideographs with Type A components（Group 19）which do not derive Component 316 from a single parent ideograph．In total，about half of the ideographs analysed have Type A components and about half have Type B components．

Table 10：Summary of Component 316 groups

| Group | Count | Tangut ideographs | Type |
| :---: | :---: | :---: | :---: |
| 1 | 36 |  <br>  | A |
| 2 | 7 |  | A |
| 3 | 14 |  | A |
| 4 | 9 |  | A |
| 5 | 4 |  | A |
| 6 | 13 |  | A |
| 7 | 7 |  | A |
| 8 | 2 | 等坆 | A |
| 9 | 2 | 叚坆 | A |
| 10 | 2 | 喥娘 | A |
| 11 | 3 | 版㘖边哴 | A |
| 12 | 2 |  | A |
| 13 | 3 |  | A |
| 14 | 2 | 车哏髟 | A |
| 15 | 2 | 捅能 | A |
| 16 | 2 | 薮節 | A |
| 17 | 3 | 良服鿻 | A |
| 18 | 2 | 姫蒆 | A |
| 19 | 2 | 归弱 | A |
| 20 | 3 | 蕧酸級 | A |

Investigation of Tangut unification issues

| Group | Count | Tangut ideographs | Type |
| :---: | :---: | :---: | :---: |
| 21 | 35 |  <br>  | B |
| 22 | 3 |  | B |
| 23 | 5 |  | B |
| 24 | 9 |  | B |
| 25 | 6 |  | B |
| 26 | 3 |  | B |
| 27 | 8 |  | B |
| 28 | 10 |  | B |
| 29 | 3 |  | B |
| 30 | 2 | 妾茹 | B |
| 31 | 3 | 叝慈䋺 | B |
| 32 | 5 |  | B |
| 33 | 6 |  | B |
| 34 | 3 |  | B |
| 35 | 2 | 厒裻 | B |
| 36 | 11 |  | B |
| 37 | 20 |  | B |

With only a handful of exceptions，ideographs in the same chain are all written with the same form of Component 316 （i．e．either all Type A or all Type B）．Furthermore，the use of Type A or Type $B$ is generally consistent for the same ideograph across multiple texts．

The difference between Type A and Type B forms of Component 316 can be very subtle when the component occurs in the middle of a character or on the right side of a character，as in these positions the extension of the third stroke of the Type A component may be restricted．Therefore， there are quite a few characters where it is not clear whether the component is Type A or Type B． Nevertheless，there are no obvious cases where all the sources for a given ideograph have Type A where Type B is expected，or vice versa．

The distinction between Type A and Type B components is also shown by the examples from a wider range of Tangut given in Section 6.3 ＂Evidence from Other Sources＂Table B．As for Component 267，the Western Xia sources show the same distinction between Types A and B components as Sea of Writing and Homophones，with some exceptions（for example 17DB2 黄 has a Type B component in both Sea of Writing and Homophones，but is a very clear Type A
component in Homonyms，and both A and B glyph types are found in Proverbs and Forest of Categories）．Again，the post－Western Xia sources are not as consistent in their treatment of Component 316，and in particular the Yuan dynasty edition of the Avataṃsaka Sütra writes most Type B components as Type A．In interesting difference is that for 1813F 艮，Sea of Writing and Homophones show both the left side and the right side components as Type B，whereas for the supplementary sources，the left side component is shown as Type $B$ and the right side component is shown as Type A．

The two encoded ideographs 18139 效 and 18147 敖 both incorporate Unicode Component 316 （ $\frac{Z}{k}$ ），and each have two distinct meanings and readings．As shown in Table 11，one meaning of each pair is written with the Type A component，and the other meaning is written with the Type B component．A comparison of the glyph forms in Homophones［TY］for each of these pairs， showing this clear distinction，is given in Table 9.

Table 11：Ideographs which differ by Component 316 glyph type

## 3．4 Tangut Ideograph 175F6

The Tangut ideograph 175F6 㱛 has two meanings and two readings：＂fox＂［nə］and＂tail＂［ta］．In the 1997 edition of Li Fanwen＇s Tangut dictionary there are separate entries for the two meanings of this character，and the characters are distinguished by slightly different left side components：＂fox＂is written as प文苌（Component 087）；and＂tail＂is written as 友 （Component 113）．

## Xia－Han Zidian（1997 ed．）p． 319

1841 〔怘頭音 nə（筆调不详）音能〕
00

1666

## fox

狐，野狐（同19A7，珠162）。

野狐狸也，野罝名是也（椎7．273）。

榪之濁（九288）。

## 〔舌頭音 ta 1.17 俯疑䜵都臘切 音

死怛〕
1667 tail

## （1）尾也。（名）

However，in the 2008 edition of Li Fanwen＇s dictionary the two characters are represented with exactly the same font glyph，with Component 087 on the left．On this basis the two entries for this character were unified，and only a single character encoded．

In Section 6.4 we provide glyph evidence from Sea of Writing，Homophones（Editions A and B）， Mixed Characters，Pearl in the Palm for all 33 encoded ideographs that incorporate Component 087 （ $\bar{\alpha}$ ）．Using the character derivations provided in Sea of Writing and other Western Xia sources，it is possible to group these characters into five chains：

- Group 1：Chain of 5 characters related to the meaning＂yak＂（including 妼 meaning＂tail＂）；
- Group 2：Chain of 3 characters related to the meaning＂fox＂（including 狵 meaning＂fox＂）；
－Group 3：Chain of 18 characters related to the meaning＂dog＂；
－Group 4：Chain of 4 characters related to the meaning＂pig＂；
－Group 5：Chain of 4 characters related to the meaning＂kind of grass＂．

## Investigation of Tangut unification issues

In fact，it seems quite likely that at least the first four chains are related（the years of dog and pig are adjacent to each other，and the Pearl in the Palm lists＂pig dog＂as a vocabulary item），and should be sections of a single chain of derivation．

In the Tangut texts examined there appears to be no differentiation of Component 087 （ $\bar{X}$ ）into two distinct glyph forms with separate semantics，as was the case for Components 267 and 316 discussed above．With a single exception，all examples of Component 087 in all texts are written using the same three－stroke form，and there is no obvious distinction between the glyphs for the two meanings of 175 F 6 狵．The one exception is Homophones Edition A，where the two meanings of 175F6 娀 are written quite distinctly，＂fox＂being written with an exaggerated three－stroke glyph form for Component 087 娏（with a very long first stroke not seen in other characters with Component 087），but＂tail＂being written with a two－stroke glyph form for Component 087 狄 （with a very thick join between the strokes so that it could not be mistaken for a three－stroke form）．This distinction seems to be quite deliberate，and intended to clearly distinguish＂fox＂and ＂tail＂graphically．Table 12 shows the glyph forms of 175F6 in these and various other sources．

Table 12：Examples of Ideograph 175F6

| :---: | :---: |
| Forest of Categories 06．27B5 06．30B1 <br> （in the word 狨䛧＂fox＂） |  |

In addition to Sea of Writing and Homophones，there are only two other sources that feature both meanings of 175F6．One is the manuscript text of Synonyms，which appears to follow the distinction shown in Homophones Edition A．The other text is the xylograph edition of Homonyms， which also clearly distinguishes the glyphs for the two meanings，but the glyphs are the opposite way round than Homophones Edition A（which is probably a scribal mistake）．175F6 occurs only once in the Odes，where the meaning＂tail＂is written with the two－stroke form found in Homophones Edition A．The character occurs four times in Forest of Categories with the meaning ＂fox＂，but the evidence is confusing because two instances show the three－stroke form and two instances show the two－stroke form．All other sources we have examined show the meaning＂fox＂ with the standard three－stroke form．

In summary，it seems from the available evidence that the two meanings of 175 F 6 are not distinguished in Sea of Writing or in Homophones Edition B，but they are distinguished in Homophones Edition A，Synonyms，and Homonyms．Homophones Edition A has a colophon dated 1132，and is one of the earliest surviving dated Tangut texts，so it is possible that initially there was a glyph distinction between＂fox＂and＂tail＂，but this distinction was later lost．Although this distinction is not universal，we believe that it needs to be reflected in encoding．

## 3．5 Tangut Ideograph 17134

There are two separate entries for 17134 （浐）in the Homophones Editions A and B，with different readings and meanings（＂pair＂and＂foolish＂）．There are also two entries for 17134 in the Synonyms（诊觗＝Tóngyì 同義）．However，there is no entry for either meaning of 17134 in the surviving parts of the Sea of Writing，and both meanings of the characters are not common，so do not occur together in any other source we know of．Below we give examples of the character meaning＂pair＂from Sea of Writing，Forest of Categories and Dissected Rhymes of the Five Sounds， but the only example of the character meaning＂foolish＂that we can find is from the Combined Edition of Homophones and Sea of Writing．

Investigation of Tangut unification issues

| anf |
|  |

There are few sources that use 17134，and even fewer that use both meanings，so there is not much evidence to go on．At first sight，the above examples do not seem to show any obvious glyph distinction，and in particular both meanings of 17134 incorporate the same three－stroke form of Component 068 （ $<$ ）．However，there does appear to be a distinction in the glyphs for Homophones Edition A only，where the right side of the glyph for＂pair，couple＂shows Component 027 （＂）and Component 068 （ $\times$ ）forming a single unitary component（ $k$ ），whereas the right side of the glyph for＂foolish，stupid＂looks like two separate components，with Component 027 （＂）above and extending to the right of a shorter Component 068 （ $\chi$ ）．

That the difference shown by Homophones Edition A is significant，and is not just a random variation in handwriting is confirmed from the derivations for the two meanings of 17134. According to the Combined Edition of Homophones and Sea of Writing，the character with the meaning＂foolish＂derives from the left side and middle－top of 1714D 浂［1！］＂ignorant＂（i．e．\｜and ＂）and the right side of 17B69 敨［wẹi］＂foolish＂（i．e $<$ ），which means that in this case the right side component is constructed separately from Component 027 （＂）above and Component 068 （ $<$ ）below．On the other hand，the character with the meaning＂pair＂is related to the ideograph 180B0 後＂twin＂，and Component 287 in both characters can be presumed to derive from 180AA炎［ndzin］＂one＂．

In the 2016 draft of Table of Xixia Characters with Annotated Properties（西夏字符及属性标注表）， this difference in character construction is indicated，but is not reflected in the glyph forms．The glyph for＂foolish＂uses a three－stroke form of Component 068，whereas the glyph for＂pair＂ possibly uses a two－stroke form of Component 068 ，although both characters are assigned the same stroke count．

Table of Xixia Characters with Annotated Properties（Zhonghua ziku．．．2016）p． 14

## Investigation of Tangut unification issues

We think that that the correct glyph distinction for the two meanings of 17134 is the size and positioning of Component 068 （ $<$ ）with respect to Component 027 （＂），as shown in Homophones Edition A：

We have seen above that Homophones Edition A preserves a glyph distinction between the two meanings of 175F6（＂fox＂and＂tail＂）that was lost in the B editions of Homophones，so it is plausible that in the case of 17134 Homophones Edition A preserves a distinction that was lost in the B editions，especially as this distinction matches the different character derivations．We consider that the distinction shown in the Homophones A edition should be reflected in encoding．

## 3．6 Tangut Ideograph 17E08

There are two entries in Homophones Edition B for Tangut Ideograph 17E08（般），one entry with the meaning of＂to squeeze［lice to death］＂with reconstructed reading djwu（TY A 17A15；TY B 17B55），and one entry with reconstructed reading djwi which is used as a transliteration character（TY B 20B64）．The glyph forms of the character appear to be identical in all cases，with the same three－stroke form of Component $068(\chi)$ in the middle．

Under the entry in Homophones Edition B for the meaning it is noted：勿㛂㭚液＂one character， two names＂（i．e．two readings）．This is the only entry in Homophones to have a notation like this． The Sea of Writing（I 09．243）only has a single entry for this character，but it gives both the meaning of＂to squeeze（lice）＂with the fănqiè gloss 殹／旅 dji／ljwu（＝djwu），and the transliteration with the fǎnqiè gloss 毅／盎 djwu／ljwi（＝djwi），along with a note very similar to
 Given that the phonetic values of the two meanings of this character are very close，and two sources explicitly note that the character has two readings，it seems likely that the two entries are slightly different phonetic reflexes of the same character．Perhaps the pronunciations of the meaning＂to press＂and its transliteration pronunciation had diverged over time．The fact that Homophones Edition A does not have an entry for the use as a transliteration character suggests that the A edition may represent an early stage in the language，before 17E08 had acquired two readings．

Investigation of Tangut unification issues

The graphic form of the character in the two entries of Homophones is identical, and there is no evidence from other sources that there is any graphic distinction between the two meanings. Therefore, there is no justification for disunifying 17E08.

## Investigation of Tangut unification issues

## 4．Conclusion and Recommendations

## 4．1 Conclusion

Our investigation shows that：
－Tangut Component 267 actually corresponds to two graphically similar but unrelated components（ $<x$ and $<$ ）which differ by glyph construction and stroke count．
－Tangut Component 316 actually corresponds to two graphically similar but unrelated components（ $\frac{Z}{\lambda}$ and $\frac{Z}{x}$ ）which differ by glyph construction and stroke count．
－Tangut Components 068 久， 141 文 and 278 交 also each correspond to two graphically similar but unrelated components．
 each correspond to two semantically and phonetically distinct characters which are non－ cognate and are consistently differentiated at the glyph level by the use of Component 267 （the five bird－related meanings have $久$ 多，whereas the five meanings unrelated to birds have $<$ ）．
－The two encoded Tangut ideographs 18139 硺 and 18147 㟋 both correspond to two semantically and phonetically distinct characters which are non－cognate and are consistently differentiated at the glyph level by the use of $\frac{7}{\frac{7}{x}}$ or for Component 316 ．
－The encoded ideograph 175F6 㱛 corresponds to two semantically and phonetically distinct characters which are non－cognate，and which are distinguished at the glyph level in some sources，including Homophones Edition A．
－The encoded ideograph 17134 㖟 corresponds to two semantically and phonetically distinct characters which are non－cognate and which are distinguished at the glyph level in Homophones Edition A．
－The encoded ideograph 17E08 般底 corresponds to two semantically and phonetically distinct characters which are cognate and are not differentiated at the glyph level．
－The encoded ideographs 182F5 㢺 and 180D6 效 should have the same left side component （Component 412：首），but are differentiated by the middle component（ $\frac{\chi}{x}$ for 182F5，and for 180D6）．

We conclude that the following seven Tangut ideographs should be disunified，as Jia and Jing suggested at the Yinchuan meeting in 2016：

- 17F0D 談 $\Rightarrow$ 談（source ref．L2008－3435）and 㷋（source ref．L2008－3436）
- 17F8A 父 $\Rightarrow$ 父（source ref．L2008－2252）and 奴（source ref．L2008－2253）
- 17FA5 㷋 $\Rightarrow$ 婒（source ref．L2008－3684）and 婒（source ref．L2008－3683）
- 18139 㸚 $\Rightarrow$ 叞（source ref．L2008－1317）and 敢（source ref．L2008－1318）
- 18147 煖 $\Rightarrow$ 磁（source ref．L2008－1734）and 磁（source ref．L2008－1735）
－184F1酸 $\Rightarrow$ 酸（source ref．L2008－1106）and 數（source ref．L2008－1107）

We think that the following two Tangut ideographs should also be disunified，pending agreement from other Tangut experts，as in both cases the glyph forms are distiguished in the important A edition of Homophones：
- 17134 㖟 $\Rightarrow$ 㥅（source ref．L2008－3488）and 悛（source ref．L2008－3489）
- 175F6 娀 $\Rightarrow$ 茙（source ref．L2008－1666）and 娀（source ref．L2008－1667）

## 4．2 Solution

Two possible solutions were mentioned at the Yinchuan meeting in 2016：
A．For each character requiring disunification，encode one new character to represent one of its meanings and glyph forms．
B．Define two variation sequences for each character with two glyph forms，one variation sequence for the Type A glyph and one variation sequence for the Type B glyph．

Variation sequences＂provide a mechanism for specifying variants ．．．that have essentially the same semantics but substantially different ranges of glyphs＂（The Unicode Standard version 11.0 .0 p .872 ），but are not an appropriate option in cases where the two glyph forms of each character are both visually and semantically distinct from each other．We believe we have demonstrated in this document that the glyph differences are semantic，and as the different forms of each encoded character are constructed from different source characters the two forms of each encoded character are also non－cognate．We strongly support applying the criterion for disunification defined for CJKV ideographs in the IRG Principles and Procedures version 11 （http：／／appsrv．cse．cuhk．edu．hk／～irg／irg／irg50／IRGN2310SC2N4611WG2N4979IRGPnP11．pdf） Section 2．1．3＂Non－cognate Rule＂（emphasis added）：

Ideographs with different glyph shapes that are unrelated in historical derivation （non－cognate characters）are not unified no matter how similar their glyph shapes may be．

If we apply this rule to Tangut encoding then it necessary to disunify each existing character under consideration to two separate code points rather than define variations sequences for each single code point．

### 4.3 Costs and Benefits of Disunification

## A. Costs

- Existing Unicode data containing the disunified characters will need to be evaluated, and if necessary new code points will need to be substituted for any existing code points for disunified characters with the meaning corresponding to the new characters.
- Unicode Tangut fonts will need to be updated to include the new characters.
- Applications that use the Unicode Tangut data will need to be updated for the new data file (which should in most cases be done automatically for each new version of the standard any way).

## B. Benefits

- Users will be able differentiate the two meanings of each disunified character in search operations and textual analysis.
- There will be better mapping between the UCS and Mojikyō and other legacy character sets (which assign two different code points to the disunified characters).
- The UCS will more correctly reflect Tangut orthography.
- The improvement in the UCS representation of Tangut characters will likely increase the uptake in Unicode Tangut by users.

The main cost of disunification is the effect it may have on existing Unicode Tangut data, but this can be considerably reduced by keeping the most frequently-occurring meaning of each disunified pair of meanings at the original code point, and encoding the least common meaning of each pair at a new code point. Doing this would mean that existing Unicode text containing only the most common meanings of the disunified characters will not be affected by the disunifications.

The costs of disunification are further mitigated by the fact that adoption of Unicode Tangut by scholars working in the field is still very limited, and there are not many large databases or collections of Tangut data or texts in Unicode encoding. Moreover, the few users who do have large collections of Unicode Tangut data and text, such as Andrew West, are quite capable of applying the disunifications to their data and texts.

The limited adoption of Unicode Tangut to date is evidenced by the special Tangut issue of the Journal of Chinese Writing Systems (vol. 2 issue 3) [https://journals.sagepub.com/toc/cwsa/2/3] which was published in September 2018. This issue comprises eight papers that incorporate Tangut text, of which the six papers by mainland China scholars use a legacy CJK hack encoding for Tangut text, and only the two papers by Andrew West (UK) and Tai Chung-pui (Hong Kong, China) use Unicode Tangut.

These factors suggest that the benefits of disunification outweigh the costs, and in order to minimise any disruption and inconvenience to Tangut users, the disunifications should be made as soon as possible.

## 4．4 Recommendations

We recommend making the following changes：
－Encode five new Tangut components at 18AFA．．18AFE as disunified forms of Tangut Components 068 （ 文）， 141 （文）， 267 （父）， 278 （交）and 316 （交）．
－Encode seven new Tangut ideographs at 187F8．．187FE as disunified forms of Tangut
 （致）， 18736 （荋）．
－Consider encoding two new Tangut ideographs as disunified forms of Tangut Ideographs 17134 （愋）and 175F6（娏）．
－Modify the glyph and radical for 180D6（綖）．
－The Tangut data file should be expanded to include a new key which gives the radical number and total stroke count for all encoded Tangut ideographs listed in Jia and Jing＇s Table of Xixia Characters with Annotated Properties（西夏字符及属性标注表）or other suitable document．The existing kRSTUnicode key should not be changed as it reflects the system used to order the set of Tangut ideographs．Users can decide to use either the original kRSTUnicode key or the new key for sorting and other purposes．
－A new Tangut font which reflects Jia and Jing＇s analysis of the structure of Tangut components and ideographs should be provided for the code charts．This could be a modification of the existing font or a completely new font provided by China．

The new Tangut ideographs and components should be encoded at the earliest opportunity，but the new font and additional data are not so urgent．The font and data can be prepared while the encoding process is ongoing，with the aim of being ready for the versions of Unicode and ISO／IEC 10646 that includes the new characters，but this is not essential．

The proposed character additions are shown in Table 14，and changes to existing characters are summarized in Table 15．There are three points that should be noted：
－As discussed above，disunification is least disruptive if the most common meaning of each disunified character remains with the existing character，and the new character is assigned to the less common meaning．It turns out that for the five ideographs with Component 267，in each case the meaning with the Type A glyph is less common，and so proposed to be assigned to a new code point．For the two ideographs with Component 316，in both cases the meaning with the Type B glyph is less common，and so proposed to be assigned to a new code point． For 17134 the meaning＂pair＂is more common than the meaning＂foolish＂，and for 175F6 the meaning＂fox＂is more common than the meaning＂tail＂，and so the meanings＂foolish＂and ＂tail＂are proposed to be assigned to new code point．
－The proposed radical and stroke count values for the new disunified ideographs are the same as for the corresponding existing ideographs．This is because they are intended to reflect the current system of radicals and method for counting strokes，so as to be consistent with all other encoded Tangut ideographs．New radical assignments and stroke counts for these
characters should be part of the new radical／stroke data to be added as a new key to the Tangut data file．
－The source references for the disunified ideographs need to be divided into two，and one part assigned to the corresponding new code point．

Table 14：Proposed Character Additions

| C／P | Glyph | Source Reference or Character Name | Radical／ <br> Strokes | Notes |
| :---: | :---: | :---: | :---: | :---: |

## Notes

1．For each disunified character，one glyph form is essentially the same as for the existing glyph． However，in order to more clearly distinguish the disunified glyph forms，the existing glyph may be slightly modified so as to accentuate the differenence between disjoined and joined components（e．g．for 175F6 the tip of the first stroke has been elongated）．

2．If it is agreed to disunify 17134 and 175F6，it will be necessary to create a new Tangut Extended block．It is anticipated that in the future there will be occasional proposals to encode a small number of additional Tangut ideographs，but as minor glyph variations should be dealt with by means of Ideographic Variation Sequences，we think that an additional block of 64 code points should be sufficient for Tangut encoding needs for the foreseeable future．Therefore we suggest allocating a Tangut Extended block at 18D00．．18D3F．

Precious Rimes of the Sea of Writing（Wenhai Baoyun）［WHBY］．ịiwạ ngôn ldịa mbiu u
 copy of an abridged version of the Sea of Writing（Wenhai）dictionary．Institute of Oriental Manuscripts of the Russian Academy of Sciences（Saint Petersburg，Russia）．Tangut fond． Pressmark Tang 14／3，old inventory № 8364．Published as Wenhai Baoyun，Edition B（乙種本）in：ECHW 7，p．177－232．For details see：Kychanov 1995.
 Matching Proverbs＝Xīn jí jǐn chéngduì yànyǔ 新集錦成對諺語 or Xīn jí jǐn hécí 新集錦合辭］． Blockprint edition with colophon dated 1187．Institute of Oriental Manuscripts of the Russian Academy of Sciences（Saint Petersburg，Russia）．Tangut fond．Pressmark Tang 35／1，old inventory № 765．Published as Edition A（甲種本）in：ECHW 10，p．328－343．

Sea of Writing（Wenhai） 1 ［WH 1］．‘iwạ ngôn 倠硑［Sea of Writing＝Wénhǎi 文海］．Blockprint edition．Volume 1，covering level tone characters（Volume 2，covering rising tone characters，has not been preserved）．Institute of Oriental Manuscripts of the Russian Academy of Sciences（Saint Petersburg，Russia）．Tangut fond．Pressmark Tang 14／1，old inventory № 211.
 Category＝Wénhǎi zálèi 文海雜類］．Blockprint edition．Volume 3，covering a mixture of level tone and rising tone characters．Institute of Oriental Manuscripts of the Russian Academy of Sciences（Saint Petersburg，Russia）．Tangut fond．Pressmark Tang 15，old inventory № 213，7297．In：ECHW 7，p．166－176．

Synonyms（Tongyi）［TYi］．wo lew 瞢䑷［Synonyms＝Tóngyì 同義］．Blockprint edition with colophon dated 1188．Institute of Oriental Manuscripts of the Russian Academy of Sciences（Saint Petersburg，Russia）．Tangut fond．Pressmark Tang 24／1，old inventory № 2539.

Three Generations（Sanshishu Mingyan）［SSMY］．so śíei ndźwi swew ngwu śíou •ịiwạ
 míngyán jíwén 三世屬明言集文 or Collection of Words Transmitted From Person to Person through Three Generations＝Sāndài xiāngzhào yán wénjí 三代相照言文集］．Edition printed using movable type．Institute of Oriental Manuscripts of the Russian Academy of Sciences （Saint Petersburg，Russia）．Tangut fond．Pressmark Tang 27，old inventory № 4166.

## Note on Homophones（Tongyin）editions

There are two xylographic editions of Homophones，A and B．Edition A is only preserved as a single copy at the Institute of Oriental Manuscripts and a single small fragment at the British Library，but there are several different exemplars of Edition B printed from the same or different woodblocks（i．e．original or recarved woodblocks for the same edition）．However，Chinese researchers divide Homophones into four editions，A，B，C and D（Chinese 甲種本，乙種本，丙種本，丁種本），where Chinese Edition A corresponds to actual Edition A，and Chinese Editions B，C and D are different exemplars of actual Edition B（see ECHW 7）．In our previous technical documents on encoding of Tangut script prepared for UTC and WG2 in 2008－2018，for compatibility with the Chinese scheme we referred to the exemplars of Edition B as Editions B，C and D．As the Chinese Edition B is actually a composite of three different exemplars（with different inventory numbers）， we specified the exemplars corresponding to Chinese Edition B as B1，B2 and B3．In this document we use a less confusing and more logical scheme of reference，with different exemplars of Edition B referred to as B1（previously B1），B2（previously B2），B3（previously B3），B4 （previously C），B5（previously D）etc．

## Note on Tangut readings

Tangut readings in this document are M．V．Sofronov＇s reconstructed pronunciations as given in E．I．Kychanov＇s Tangut dictionary（Kychanov 2006）．Where there is no reading for a particular character in Kychanov＇s dictionary，we use the reading given in Sofronov 1968 if available，with the transcription modified to match the usage in Kychanov 2006.

## 6. Appendix: Evidence for Glyph Forms

The tables below list all Tangut ideographs that belong to the same chain of derivation. The main source for derivation is the Sea of Writing, but if there is no entry for an ideograph in the Sea of Writing then the derivation given in either the Combined Edition of Homophones and Sea of Writing or the Precious Rimes of the Sea of Writing is used instead if available. For quite a few ideographs there is no surviving entry in any of these sources, and so no derivation is available. However, in some of these cases we can make a reasonable guess at the character derivation, in which case our proposed derivation is put in square brackets.

## Key to Columns:

$\mathbf{C} / \mathbf{P}$. Unicode code point.
Glyph. Glyph using the Tangut Yinchuan font.
WH. Image of the character in the Sea of Writing. Where possible this is the image of the head entry for the character. If the image is not from the head entry then the reference is marked with an asterisk.
TY A / B. Image of the character in Homophones Edition A and/or Edition B. If the image is from a gloss because there is no surviving head entry then the reference is marked with an asterisk.
ZZ. Image of the character in Mixed Characters (black and white images from Nakajima et al. 1997; greyscale images from Terentiev-Katansky et al. 2002; and colour images from the British Library fragments).
ZZZ. Image of the character in Pearl in the Palm.
Refs. Reference for Sea of Writing (WH), Homophones (TY), Combined Edition of Homophones and Sea of Writing (TYWH), and Precious Rimes of the Sea of Writing (WHBY). References for Mixed Characters and Pearl in the Palm are omitted as each character may occur in multiple places for these two texts.
Meaning. The simple English definition for the character in Li Fanwen's 2008 Tangut-Chinese Dictionary; and M. V. Sofronov's reconstructed pronunciation of the character as given in E. I. Kychanov's 2006 Tangut dictionary.
Parent. The code point and glyph of the parent character which is the source for the component ( 267 or 316 ).
Type. The glyph type of the component: A, B, or A/B (where different sources show different glyph types). Where a character includes the component in two places, the type for each occurrence of the component is given, with " 1 ", " $m$ " or " $r$ " in parentheses to indicate the left, middle or right position respectively.

## 6．1 Evidence for Component 267

## 6．1．1 Ideographs with Component 267 Type $A$

Groups 1 through 18 have Type A Component 267 （炎），i．e．written with five strokes．

## 6．3 Evidence from Other Sources

In order to check whether the distinction between Type A and Type B glyph forms shown in the tables in Sections 6.1 and 6.2 are maintained throughout the Tangut corpus，this section provide a sample of 36 characters with Component 267 and 28 characters with Component 316 from a range of different types of texts dating from the Western Xia，Yuan and Ming periods．
－SSMY．Collected Writings of the Shining Speech of Three Generations（Sānshishǔ míngyán jíwén三世屬明言集文），a Western Xia Buddhist text printed using movable type
－TM．Homonyms（Zéyào chángchuán tóngmíng zázì 擇要常傳同名雜字），a Western Xia xylographic edition of a linguistic text
－YY．Proverbs（Yànyǔ 諺語），a Western Xia xylographic edition of a secular literary text （colophon dated 1187）
－Odes．Odes（Shī 詩），a Western Xia xylographic edition of a secular poetic text（colophons dated 1185－1187）

- LL．Forest of Categories（Lèilín 類林），a Western Xia xylographic edition（colophon dated 1181）
- SJ．Newly Collected Grains of Gold Placed in the Palm Text（Xīnjí suijīn zhìzhǎngwén 新集碎金置掌文），a Western Xia hand－written text
－HYJ．Avataṃsaka Sūtra（Dàfāngguăng fó huáyán jīng 大方廣佛華嚴經），a xylographic edition of a Buddhist sutra thought to have been printed during the Yuan dynasty
－JYG．Yuan dynasty Buddhist inscriptions at Juyong Pass，dated 1345
－BD．Ming dynasty dhāraṇī pillar inscriptions at Baoding，dated 1502
The characters in the tables below are colour－coded to indicate whether or not the glyph form corresponds to the expected glyph type（A or B）：green indicates that it is the expected glyph type； red indicates that it is an unexpected glyph type；and yellow indicates that the glyph type is unclear or ambiguous，or that both A and B types are attested．
