1 Introduction

This proposal is a major revision and expansion of L2/20-193. It not only supersedes L2/20-193, but may also be considered a full replacement of all previous proposals submitted for encoding Proto-Cuneiform in Unicode, namely:

- L2/16-267: “Preliminary proposal to encode Proto-Cuneiform in the SMP of the UCS” (Everson)
- L2/17-157: “Proposal to encode Proto-Cuneiform in the SMP of the UCS” (Everson)
- L2/19-284: “Proposal to Encode Proto-Cuneiform in the SMP of the UCS” (Everson)
- L2/20-193: “Preliminary proposal to encode Proto-Cuneiform in Unicode” (Pandey)

The current document maintains the principle, stated in L2/20-193, of encoding all distinctive signs required for the complete encoding of extant Proto-Cuneiform texts, as attested in the Proto-Cuneiform sign list of the Cuneiform Digital Library Initiative (CDLI), which was created and maintained by the late Robert Englund. Previous proposals, such as L2/17-157, recommended the encoding of only the most common signs. The rationale was that a set of those 277 common signs may be used for encoding nearly 85% of all signs occurring in Proto-Cuneiform records. However, as a practical matter, a truly useful repertoire for Proto-Cuneiform in Unicode should provide for the representation of all distinctive signs, attested to date, in order to enable representation of the extant Proto-Cuneiform corpus.

In order to fulfill that aim, this proposal expands upon L2/20-193 in the following ways:

- Full enumeration of sign variants, achieved by separating CDLI variants from vertical stacks within an image file for a sign into individual glyphs
- Identification of signs occurring in compounds, but which are not independently enumerated in the CDLI sign list
- Classification of compound signs into ‘atomic’ and ‘composable’ categories for purposes of character encoding
- Expanded analysis of all compound signs into their constituent elements
- Introduction of format control characters for enabling the representation of ‘composable’ compound signs in plain text, instead of encoding all such compounds as individual characters
- Refined proposed character repertoire, consisting of distinctive numeric signs, ideographic signs, atomic compounds
- Documentation of character properties and line-breaking characteristics

2 Next Steps

In order to advance the encoding of Proto-Cuneiform in Unicode, I request feedback on the following issues.

- How to handle the representation of variants. At present, I’ve included all variant forms as independent characters in the proposed repertoire. If variants are to be excluded from the repertoire, what

are the factors for exclusion? Secondly, among the variants, which form should be considered the representative form for the character?

- How to handle signs that are not identified independently in the CDLI list, but that are used in compounds? It is necessary to encode these as distinctive signs in order to enable the encoded representation of compounds.
- Is the distinctiveness of variants for certain signs semantic, or purely graphical? Is there a chronological or geographical or functional distinction?
- Is there a semantic distinction between touching and non-touching forms of the same sign when it occurs in a stack?

3 Background

The earliest attested script emerged at the end of the 4th millenium BCE in Mesopotamia. It was a pictographic script, whose signs were pressed into clay tablets, initially for administrative and book-keeping purposes. These pictographs developed into more abstract signs, which evolved into the writing system known as ‘cuneiform’. Accordingly, the early script is known to scholars as ‘proto-cuneiform’.

An encoding for Proto-Cuneiform in Unicode would provide for plain-text representation of the script and enable users to encode signs as actual characters instead of as images. Proto-Cuneiform signs are depicted extensively in publications, both in charts and in running text (see fig. 1–2).

4 Overview of Attested Signs

The CDLI repertoire contains 2095 sign, which according to my analysis, consists of 349 individual numeric signs, 1106 individual ideographic signs, and 640 complex signs. Of these, 2050 are ‘complete’ signs, while 45 are ‘fragmentary’, meaning that a portion of the sign is not fully identifiable. Only the ‘complete’ signs are suitable for encoding.

class	type	number of components	complete signs	fragmentary signs	class total
individual	numeric	1	349	—	1,455
	ideographic	1	1,106	—	
complex	numeric	2	3	—	640
		ideographic	2	403	
		3	38	8	
		4	2	—	
	numero-ideographic	2	28	—	
		ideo-numeric	2	97	
		3	20	3	
		4	3	—	
	5	1	—		
			2050	45	2095

The CDLI naming convention for signs is used here. Numeric signs are denoted using ‘N’. The number preceding ‘N’ indicates the value of the sign, and the number following ‘N’ refers to a decipherment sequence, not any inherent value of the sign. Ideographic sign names are based upon values of the signs.

The tables show Proto-Cuneiform signs separated into numeric and general ideographic categories. Provided for each sign is a generic serial number for references purposes, one or more digitized glyphs, the conventional name, and a tentative Unicode character name.

In cases where variant signs are attested for a sign, all distinct variants as shown in a vertical stack. For such cases, the representative glyph will be identified in collaboration with experts.

Compound signs are currently proposed as they are enumerated in the CDLI sign list. As specified in § 6, the encoding model for compounds requires additional considerations.

5 Analysis of Compound Signs

5.1 Typology of compounds

Compounds or complex signs are individual signs that are written as a single unit using various techniques, such as joining, stacking, or embedding, or one or more combinations of these. The majority of complex units consist of 2 signs, but slightly more than a hundred have 3 or more signs. The following table shows my analysis of the typologies and compositions of Proto-Cuneiform complex signs:

Type	# Signs	Pattern	Count	
numeric	2	N×N	2	
		N·N	1	
ideographic	2	I×I	371	
		I·I	38	
		I+I	14	
		I&I	12	
	3	3	I×I·I	25
			I&I·I	5
			(I×I·I)	3
			I×I+I	3
			I&I×I	2
			I×(I&I)	2
			I×(I×I)	2
			I&I&I	1
			I·I&I	1
			I×I&I	1
	I×I×I	1		
	(I+&I)×I	1		
	4	4	I×(I·I·I)	1
numero-ideographic	2	N·I	29	
ideo-numeric	2	I×N	84	
		I·N	14	
	3	3	I×N·N	11
			I·N·N	4
			I×N·I	3
			I×I·N	2
			I&I×N	1
			I×I+N	1
			I×I×N	1
	4	4	I×(I·N·I)	1
			I×N&I+N	1
			I×N·N·N	1
	5	5	I·(I+N+I+N)	1

The above table refers to the following types of complex signs:

numeric (N)	only numeric signs
ideographic (I)	only ideographic signs
numero-ideographic	numeric sign as the first element and 1 or more ideographic signs
ideo-numeric	ideographic sign as the first element and 1 or more numeric signs

and the following operators that denote sign structures:

(...)	a group of signs
×	the following sign is embedded within the preceding sign
+	the preceding sign is joined or fused to the following sign
&	the preceding sign is stacked vertically above the following sign
.	the preceding sign is placed beside, but not joined to the following sign

5.2 Signs in compounds without independent attestation

There are 21 signs that occur in compounds, but which are not attested independently:

	Compound sign	#	Glyphs	Unattested
	1N ₅₈ · BAD _a	1	, BAD a	BAD _a
	1N ₅₈ · BAD _b	1	, BAD b	BAD _b
	1N ₅₈ · BAD _b – var. 1	1	, BAD b	BAD _b
	AMAR × TAR	1	∑, TAR	TAR
	(BU _a & BU _a) · NA2 _a nutillû	1	⊗, ⊗, NA2 a@n	NA2 _a nutillû
	(BU _a & BU _a) · NA2 _b	1	⊗, ⊗, NA2 b	NA2 _b
	DARA3 _c × KAR2	1	✎, KAR2	KAR2
	DARA3 _c × (KAR2 · ŠE _a)	1	✎, KAR2, ≡	KAR2
	DARA3 _d × KAR2	1	✎, KAR2	KAR2
	DARA3 _d × KAR2 – var. 1	1	✎, KAR2	KAR2
	DARA3 _d × KAR2 – var. 2	1	✎, KAR2	KAR2
	DARA3 _d × (KAR2 · ŠE _a)	1	✎, KAR2, ≡	KAR2

	Compound sign	#	Glyphs	Unattested
	DU × DIŠ	1	, DISZ	DIŠ
	DU6 _a × DIŠ	1	, DISZ	DIŠ
	(DUB × DIŠ) _a	2	DUB, DISZ a	DIŠ
	(DUB × DIŠ) _b	2	DUB, DISZ b	DIŠ
	(DUB × DIŠ) _c	2	DUB, DISZ c	DUB
	DUG _b × ANŠE _d	1	, ANSZE d	ANŠE _d
	E2 _a × 1N ₅₇ tenû	1	, 1N57@t	1N ₅₇ tenû
	E2 _b × 1N ₅₇ tenû	1	, 1N57@t	1N ₅₇ tenû
	EŠDA × TAR	1	, TAR	TAR
	GIR3 _c × KAR2	1	, KAR2	KAR2
	GIŠ × ŠU2 _a	1	, SZU2 a	ŠU2 _a
	GIŠ × ŠU2 _b	1	, SZU2 b	ŠU2 _b
	GURUŠ _c × 2N ₁₄	1	GURUSZ c, ●	GURUŠ _c
	HI × 1N _{1F}	1	, 1N01F	1N _{1F}
	HI × 1N ₅₇ tenû	1	, 1N57@t	1N ₅₇ tenû
	KA2 × LAM	2	KA2, LAM	LAM
	LAGAB _b × KUR _e	1	, KUR e	KUR _e
	NINDA2 × GUDU4	1	, GUDU4	GUDU4
	NINDA2 × GUDU4 – var. 1	1	, GUDU4	GUDU4
	NINDA2 × GUDU4 – var. 2	1	, GUDU4	GUDU4
	NINDA2 × GUDU4 – var. 3	1	, GUDU4	GUDU4

	Compound sign	#	Glyphs	Unattested
	$NINDA_2 \times (UDU_a \times TAR)_a$	1	 ,  , 	TAR
	$NINDA_2 \times (UDU_a \times TAR)_b$	1	 ,  , TAR b	TAR
	$NUN_a + EN_d$	1	 , EN d	EN _d
	$SAG \times GE\check{S}TU_c$	1	 , GESZTU c	GE \check{S} TU _c
	$SILA_3_d \times NI_a$	1	SILA3 d, 	SILA3 _d
	$U_4 \times 1N_{1F}$	1	 , 1N01F	1N _{1F}
	$(U_8 \times TAR)_b$	1	 , TAR b	TAR
	$(UDU_a \times TAR)_a$	1	 , 	TAR
	$(UDU_a \times TAR)_b$	1	 , TAR b	TAR
	$UR_a \times KAR_2$	1	 , KAR2	KAR2
	$UR_2 \times TAR$	1	 , TAR	TAR
	$URU_{a3} \times KALAM_a$	1	URU a3, 	URU _{a3}
	$U\check{S}_b \times TAR_c$	1	 , TAR c	TAR _c
	$U\check{S}_b \times TAR_c - \text{var. 1}$	1	 , TAR c	TAR _c
	$ZATU\ 759\ ten\hat{u} \times X$	1	ZATU759@t, X	ZATU 759 ten \hat{u}
	$(ZU \ \& \ ZU) \cdot SAR_a$	2	ZU, ZU, 	ZU

Feedback from experts regarding these signs is requested. It may be necessary to define these components as individual signs.

5.3 Summary of Primary Element in Compounds

An overview of the primary signs in the 640 compounds is given below.

	First Element	Count	Compound Types
	DUG _b	56	I×I [45], I×(I·I) [7], I×N [2], (I&I)×N [1], I×(N·I) [1]
	U4	52	I×N [21], I·N [10], I×(N·N) [6], I×N·N [5], I·(N·N) [4], I×N·I [2], I·I [1], I×(I+N) [1], I×I [1], I×N·(N·N) [1]
	SILA _{3a}	36	I×I [33], I×N [2], I×(I·I) [1]
	NINDA2	32	I×I [15], I×(I·I) [7], I×N [4], I×(I×I) [2], I×(I+I) [1], I×(I·I·I) [1], I×(I·N) [1], I×(I×N) [1]
	GA _{2a1}	32	I×I [25], I×(I·I) [3], I×(I&I) [2], I×N [2]
	LAGAB _a	22	I×I [20], I×(I+I) [1], I×N [1]
	ZATU737	18	I×I [18]
	GI	14	I×I [7], (I&I)×I [2], I×N [2], (I+&I)×I [1], I&I [1], I&I&I [1]
	EZEN _a	14	I×I [12], I×(I·I) [1], I×(I·N·I) [1]
	MAH _a	13	I×I [12], I×(I×I) [1]
	LAGAB _b	12	I×I [11], I×N [1]
	GAN _c	12	I×I [10], I×(I·I) [2]
	ŠU2	10	I·I [7], I·N [2], I·((I+N)+(I+N)) [1]
	URU _{a1}	9	I×I [7], I×N [2]
	UKKIN _b	9	I×I [5], I×N [3], I×(I·N) [1]
	HI	9	I×N [4], I×I [3], (I×N)&(I+N) [1], I·I [1]
	GA _{2a2}	9	I×I [7], I×(I·I) [1], I×N [1]
	ZATU651	8	I×I [8]
	DUG _a	8	I×I [7], I×N [1]
	BU _a	8	(I&I)·I [4], I×I [2], I+I [1], I×N [1]
	AB _a	8	I×I [6], I×(I&I) [1], I×N [1]
	3N ₅₇	8	N·I [8]
	SAG	7	I×I [6], I×N [1]

	First Element	Count	Compound Types
	MUŠEN	6	I×N [3], I×I [2], I·I [1]
	GIŠ	6	I×(I·I) [3], I×I [2], I·I [1]
	A	6	I×I [5], I×N [1]
	ŠITA _{a1}	5	I×I [4], I×N [1]
	SILA _{3b}	5	I×I [5]
	NUN _a	5	I+I [5]
	MA	5	I×I [3], I×N [2]
	ZATU759	4	I×I [3], I×(I+I) [1]
	SUKUD	4	I+I [4]
	SAL	4	I·I [3], I×N [1]
	MAH _b	4	I×I [4]
	GA2 _b	4	I×I [4]
	4N ₅₇	4	N·I [4]
	2N ₅₇	4	N·I [4]
	1N ₅₇	4	N·I [3], N·N [1]
	ZATU714	3	I×I [2], I·I [1]
	ZATU659	3	I×N [3]
	UŠ _b	3	I×I [2], I&I [1]
	ŠE _a	3	I·I [2], I&I [1]
	MAR _b	3	I×I [2], I×(I·I) [1]
	KU6 _a	3	I+I [2], I·N [1]
	GUG2	3	I×I [3]
	E2 _a	3	I×N [2], I·I [1]
DUB	DUB	3	I×I [3]
	DU8 _c	3	I×I [3]
	AMAR	3	I&I [1], I·N [1], I×I [1]

	First Element	Count	Compound Types
	AB _b	3	I×I [3]
	ZATU711	2	I×I [2]
	UR2	2	I×I [1], I×N [1]
	UDU _a	2	I×I [2]
	ŠU	2	I&I [1], I×N [1]
	ŠITA gunô _a	2	I×N [2]
	ŠA	2	I×I [2]

6 Proposed Encoding Model

The proposed encoding model for Proto-Cuneiform is based upon the principles used for encoding Sumerian-Akkadian cuneiform. It adopts the following definitions from § 11.1 of *The Unicode Standard*, in which references to ‘Cuneiform’ should be interpreted as meaning ‘Proto-Cuneiform’:

Simple Signs Most Cuneiform signs are simple units; each sign of this type is represented by a single character in the standard

Complex and Compound Signs Some Cuneiform signs are categorized as either complex or compound signs. Complex signs are made up of a primary sign with one or more secondary signs written within it or conjoined to it, such that the whole is generally treated by scholars as a unit; this includes linear sequences of two or more signs or wedge-clusters where one or more of those clusters have not been clearly identified as characters in their own right. Complex signs, which present a relative visual unity, are assigned single individual code points irrespective of their components. Compound signs are linear sequences of two or more signs or wedge-clusters generally treated by scholars as a single unit, when each and every such wedge-cluster exists as a clearly identified character in its own right. Compound signs are encoded as sequences of their component characters. Signs that shift from compound to complex, or vice versa, generally have been treated according to their Ur III manifestation.

Mergers and Splits Over the long history of Cuneiform, a number of signs have simplified and merged; in other cases, a single sign has diverged and developed into more than one distinct sign. The choice of signs for encoding as characters was made at the point of maximum differentiation in the case of either mergers or splits to enable the most comprehensive set for the representation of text in any period.

Following this approach, all attested, distinctive individual Proto-Cuneiform signs are encoded as independent characters. Compound signs that cannot be simply reconstructed using the basic forms of the constituent signs are also proposed for encoding as independent characters.

Additionally, a set of format control characters are proposed for handling the encoded representation of compound signs, whose composition consists of the basic forms of its constituents.

6.1 Proposed Character Repertoire

The proposed Unicode repertoire for Proto-Cuneiform contains the following characters:

- 359 numeric signs, including variant forms
- 1340 ideographic signs, including variant forms

- 126 atomic compound signs, including variant forms
- 10 format control characters for encoding compounds

6.2 Format Control Characters

The following format control characters are proposed for representing ‘composable’ compound signs:

	PROTO-CUNEIFORM BEGIN GROUP
	PROTO-CUNEIFORM END GROUP
	PROTO-CUNEIFORM HORIZONTAL NON-JOINER
	PROTO-CUNEIFORM HORIZONTAL JOINER
	PROTO-CUNEIFORM HORIZONTAL INSERTION
	PROTO-CUNEIFORM VERTICAL NON-JOINER
	PROTO-CUNEIFORM VERTICAL JOINER
	PROTO-CUNEIFORM CONTAINER
	PROTO-CUNEIFORM OVERLAY
	PROTO-CUNEIFORM REVERSE

6.3 Naming Convention for Characters

Scholarly sign names have been normalized to produce Unicode character names as follows:

- The ‘@’ used for indicating variants has been replaced by full names
- Operators used in compound names have been replaced with descriptive terms
- Letters with diacritics have been transliterated into digraphs

Variants	Operators	Diacritics
@g gunu	× CONTAINING	§ SH
@t tenu	+ JOINED	
@n nutillu	& OVER	
@s seshshig	. BESIDE	
@r reversed		
@f flat		

Feedback on character names is sought in order to develop names that effectively convey the meaning and values of signs and formations of complex graphemes.

7 Compound Signs by Composition

7.1 Atomic Signs

The following 90 signs (85 distinctive, 5 variants) may be considered to be ‘atomic’ compounds:

#	Sign	Name	Str	Type	Elements
1462.1		1N ₅₇ · ŠUBUR v1	N·I	overlay	—,

This project has been made possible in part by a grant from the U.S. National Endowment for the Humanities, which funded the Universal Scripts Project PR-253360-17 (part of the Script Encoding Initiative at UC Berkeley). Any views, findings, conclusions or recommendations expressed in this publication do not necessarily reflect those of the National Endowment of the Humanities.

In the second text (fig. 37), the quantities for both products are further differentiated according to an additional criterion. In this case, the respective entries are followed by the signs NAGA (𐎒) and DUB (𐎠), the meanings of which are, however, not understood. The summations are formed in two consecutive steps. In the first step, the amounts of barley groats and malt are added together separately, then the grand total of all entries was calculated.

In this text as well, the scribe made a mistake in his totals. In adding both quantities of malt, he forgot to include the four units 𐎠 in the subtotal.

Calculations in the Production of Beer and Other Cereal Products

One of the most important texts of the Erlenmeyer collection (*MSVO* 3, 2, fig. 38) discloses exceptional information about the use of the cereal products accounted for by Kushim. A scribe, probably a staff member of Kushim's office, had noted down his calculations pertaining to the exact ingredients required for nine different cereal products and eight different kinds of beer in a tabular compilation. Some of the products are noted with the respective amounts of cereals contained in them. These ingredients are denoted by the signs 𐎠, 𐎡, 𐎢, 𐎣, 𐎤, and 𐎥. Others are denoted by more specific ideograms such as 𐎦 and 𐎧. In this text, five different numerical systems were used (see chap. 6), the bisexagesimal system for the cereal products, the sexagesimal system for the beer containers, and three different systems for the measures of cereals. One of the latter was used for the specification of the quantities of the cereal ingredients contained in the products; the other two are those already discussed in connection with barley groats and malt. Not only the formal aspects of the compilation but also the fact that it is unsigned reveals that the text represents some sort of supplementary annotation to the proper administrative documents. Such documents have often been regarded as school texts, although the available documents from the administrative archive of Kushim now clearly testify that such calculations were part of regular administrative practice.

Texts containing calculations of the cereal ingredients needed for certain products belong to the most complicated arithmetical texts of the archaic period. To date, only a very few texts have been found in which such calculations were systematically carried out for various cereal products, for types of beer and so on. We know of only one text (now in the Iraq Museum, Baghdad) with features comparable to those of text *MSVO* 3, 2. One of the remarkable things about these texts is that they inform us directly about the ingredients of different cereal products. In fact, it was the study of such texts that provided the basic proofs for the decipherment of the cereal measures used in the present publication. Their special value is also to be seen in the light they shed on

the developmental stage of arithmetical techniques in the period immediately after the invention of writing.

The structure of the calculations is demonstrated by the following three examples taken from the text in question.

1. The fourth line in the first column records an amount of barley groats needed for the production of 30 units of the final cereal product (represented by the triple repetition of the sign 𐎠, the sign normally used for "10"). The final product is represented by the numerical sign 𐎠. The total amount of barley groats needed, which is represented by the sign combination 𐎠 𐎠, is obtained when 𐎠 is multiplied by 30.
2. The seventh line of the first column informs us about how much barley groats and malt (in this case equal amounts of both products) was needed for the production of five jars with a type of beer, represented by the signs 𐎠 𐎠. This line, therefore, documents the composition of this type of beer.
3. In the fifth line of the second column, the equivalent amount of barley for 1800 daily cereal rations (sign 𐎠) was calculated. The use of the sign 𐎠 points therefore to the size of such rations (approximately 0.8 liter). The figure 1800 is rendered in the bisexagesimal system, containing the sign 𐎠 for 1200 and 𐎠 for 120, which was used exclusively to quantify cereal products.

As in many other cases the present text contains an error. For a unit of the cereal product 𐎠 the scribe had written in the first text line sign 𐎠, corresponding to ten times the necessary amount of the ingredient barley groats. Although this calculation is a fairly easy one, and the remaining, more complicated calculations seem to be otherwise correct, we must assume that the detected error is merely due to a mental lapse on the part of the scribe. For the correct reading, one has to replace the sign for "one" (𐎠) with the sign denoting "ten" (𐎠).

Beer Production and Accounts of Cereal Ingredients

Finally, the documents from the administration of the official Kushim provide a rare example of a direct accounting connection between different texts. During the archaic period, running accounts apparently already existed. However, the texts are so fragmentary that the continuity of such accounts can only very rarely be traced. It should therefore be viewed as an unusual coincidence that two texts from the Erlenmeyer collection refer at two different stages to one and the same transaction, thereby clearly documenting the continuity of archaic bookkeeping as a whole.

Text *MSVO* 3, 6 (fig. 39b) documents the production of beer for four administration officials, among them a person with the

Figure 1: Examples of Proto-Cuneiform signs used in running text (from Nissen, Damerow, Englund 1993: 43).

2. THE EARLIEST MESOPOTAMIAN WRITING

THE WRITING SYSTEM AND ITS RELATIONSHIP TO SPEECH

At the root of the cuneiform writing system, as originally conceived, is the logogram, or word sign, which represents a single word or group of semantically related words (see fig. 2.5). Assigning semantically related words to a common graph was done in the interest of economy, as it limited the number of signs the writing system required and facilitated the learning of the script. For instance, the sign DU, originally a pictograph of a foot, , expressed the verbs *gen* “to go,” *gub* “to stand,” and *de₆* “to carry,” all of which share a transparent semantic relationship. Taken in isolation, one would be tempted to describe DU, and similar signs, as ideograms — signs that represent ideas or concepts — but in actuality all cuneiform signs represented specific words in a given context, and so functioned as logograms.

As Sumerian words tend to consist of (but are not exclusively) single syllables, logograms had both a semantic meaning, as representing words, as well as a phonetic value, expressing the syllabic pronunciations of those words. For example, the logogram represented by the graph KU₆ (the subscripted number is a modern convention for distinguishing homophonous signs), , has the meaning “fish” as well as the syllabic value *ku*, which is the pronunciation of the word for “fish” in Sumerian. As described above, many of these logograms had a clear pictographic relationship to their referents; other examples include the picture of a reed,  (GI₄), for the Sumerian word for “reed,” that is, *gi*, or the graph for “mountain,”  (KUR), for the word for “mountain,” *kur*. A much smaller group of logograms, however, had an arbitrary relationship to their referents, such as the sign for “sheep and goats” which consisted of a cross inscribed within a circle,  (e.g., Catalog No. 28). Through the use of the rebus principle, whereby a sign for one word could be used to express a homonym, a second class of signs arose — phonograms — which possessed sound but not meaning. That is, the phonetic value associated with one word, most often something with a ready iconic representation, could be used to write another word that was identical or nearly so in pronunciation. The rebus principle is integral to writing, as it allows for the representation of those elements of language that are not easily

represented graphically, for instance, grammatical affixes, prepositions, and — of considerable importance to the historical development of cuneiform — the phonetic rendering of personal names and foreign words. The high frequency of monosyllabic words and homonyms in Sumerian clearly facilitated this development. For instance, in later cuneiform the sign for *sar* “garden” (originally a pictograph of a garden bed, ) could be used to write the homophonous but more abstract verb *sar* “to write”; similarly, the sign originally representing “water,” , *a* in Sumerian, was used for the syllable *a*, which among other things was the phonetic shape of the locative case in Sumerian. Finally, there is a third, smaller set of signs that are referred to as determinatives. These signs were not read, but merely served as aides in reading by indicating the semantic class to which certain words belonged; trees and wooden objects, for instance, were often preceded by the logogram, *giš*, for “wood,” cities by *uru* “city,” gods by *dingir* “god,” and so on.

In its original conception, however, Sumerian writing relied almost exclusively on the logogram. Phonetic writings generated via the rebus principle played a remarkably minor role in proto-cuneiform. More certain examples of phonetic writings include: the writing of the name of the moon god, Nanna, which is written UR₁₃+NA, , where NA, , is phonetic complement with the value *na* indicating that the graph UR₁₃, , is to be pronounced *nanna*; PIRIG+NUNUZ, , where the complement NUNUZ, , has the value *za*, indicating that the composite graph has the phonetic value *az(a)*; the aforementioned sign designating a reed, , pronounced *gi*, is used to express the homophonous verb *gi* “to return”; and the syllabic, that is phonetic, spellings of the city names *Ša₃-bu* and *Gir₂-su* (Englund 2009, pp. 9–10; Krebernik 2007, p. 43). Relatively rare attestations of this kind notwithstanding, phonetic writings do not constitute an important organizing feature of the proto-cuneiform writing system. Only in the first quarter of the third millennium did phonograms, generated via the rebus principle, begin to play a significant and increasing role.

The scarcity of phonetic writings creates a number of problems connected with identifying the language of the script and determining whether proto-cuneiform can be defined as “true” writing.
