

A note on U+1AB3 COMBINING DOWNWARDS ARROW

Kirk Miller, kirkmiller, gmail.com

2024 December 13

The attestation in L2/11-202 for U+1AB3 COMBINING DOWNWARDS ARROW ◌̣ is a typographic substitute for the fusion of U+30C COMBINING CARON and U+301 COMBINING ACUTE ACCENT. The intended diacritic is used for example in Kajkavian dialectology on the consonants /č/, /šč/ and /ž/. In some sources these letters bear a discrete caron and vertical stroke, <č̣ ẓ̌>, or caron and acute accent, <č̣̣ ẓ̣̌>; in others the two diacritics are overstruck or even fused into a crown shape, <č̣̣̣ ẓ̣̣̌>, as in Figure 1. There is no attested source where an actual arrow was intended.

Semantically as well, this diacritic is seen to be a compound of caron and acute in Figure 2. Note that in this publication the diacritic is graphically caron + vertical stroke despite being identified with the acute accent; the vertical orientation of the compounded acute accent is a result of its historical origin in italic typeface and may have been an accommodation to legibility.

The Unicode proposal for this character, L2/11-202, has a single illustration (reproduced in Figure 3), where a downward arrow is indeed substituted for the intended diacritic. The description — *a voiceless sibilant, between š and χ*, where in the German tradition <χ> is a palatal fricative equivalent to IPA <ç> — makes it clear that it is indeed the same diacritic, while the fact that the s is dropped below the baseline shows this token to be a typographic hack.

The convention of compounding the caron and acute for this use traces back at least to Lepsius in the mid 19th century, where the acute accent is set at a nearly vertical angle and nests naturally inside the caron when set in italic typeface, as seen with <ṣ̌> and <ẓ̌> in Figure 4.

The question then is how to rectify this error within Unicode. The SEW suggested that a comment be added to the Core Spec, in section 7.9.2 Combining Diacritical Marks Extended, as well as an annotation to U+1AB3, and that U+1AB3 be left as an arrow diacritic.

An advantage of this solution is that if there is ever need for a downward arrow diacritic in the future, the name of U+1AB3 is the most appropriate one for it. Currently the naming of U+1AB3 fits comfortably within the set of arrow diacritics in Unicode:

- ◌ U+034E COMBINING UPWARDS ARROW BELOW.
- ◌ U+20EE COMBINING LEFT ARROW BELOW.
- ◌ U+20EF COMBINING RIGHT ARROW BELOW.
- ◌ U+034D COMBINING LEFT RIGHT ARROW BELOW.
- ◌ U+1AEA COMBINING UPWARDS ARROW ABOVE ([L2/24-080](#)).
- ◌ U+20D6 COMBINING LEFT ARROW ABOVE.
- ◌ U+20D7 COMBINING RIGHT ARROW ABOVE.
- ◌ U+20E1 COMBINING LEFT RIGHT ARROW ABOVE.
- ◌ U+1AB3 COMBINING DOWNWARDS ARROW ABOVE.

By now there may be published sources that use U+1AB3 as an arrow because of its name. If people have been using U+1AB3 as an arrow, so that its inclusion in Unicode as an arrow is now justified by use, we would not necessarily realize this because users would not send attestation for a character that already exists. The SEW recommends that typographers not change the glyph for U+1AB3 in their fonts – e.g. Gentium <◌>, Andika <◌>, Noto Serif <◌>, Noto Sans <◌>.

Core Spec

I suggest adding a paragraph like the following to the Core Spec, under section 7.9.2 Combining Diacritical Marks Extended:

Combining downwards arrow. The source glyph was a printer’s hack for a conflated caron and acute; the acute tends to become vertical in this combination due to a history of being set in italic typeface. For Croatian dialectology, use the sequence U+030C COMBINING CARON + 0301 COMBINING ACUTE ACCENT (thus: <◌>) instead of U+1AB3.

Annotation

1AB3 COMBINING DOWNWARDS ARROW ABOVE

- for Croatian dialectology, use the sequence U+030C COMBINING CARON + 0301 COMBINING ACUTE ACCENT
