

**Doc Type:** Working Group Document  
**Title:** Disunification of 3 KP-source characters  
**Source:** Kushim Jiang (姜兆勤)  
**Status:** Individual Contribution  
**Action:** For consideration by WG2 and IRG  
**Date:** 2021-08-14

## 1 Introduction

We found three pairs of characters that should be disunified.

- ♦ U+FA99 滋 & U+6ECB 滋 ([github.com/hfhchan/irg/issues/108](https://github.com/hfhchan/irg/issues/108))
- ♦ U+FAB0 練 & U+7DF4 練 ([github.com/hfhchan/irg/issues/109](https://github.com/hfhchan/irg/issues/109))
- ♦ U+FAD1 梳 & U+233D5 梳 ([github.com/hfhchan/irg/issues/110](https://github.com/hfhchan/irg/issues/110))

## 2 U+FA99

U+FA99 滋 is unified with U+6ECB 滋 according to [WG2 N2493 = L2/02-232] (U+FAA2 in file).

However, according to the evidences from G-source, the two characters should be disunified.

- ♦ 滋 (G0-574C, KP0-E6B3)
  - [汉语大字典, pp.1807–1808](#): zī, cí.
- ♦ 兹 (KP1-52B4, UTC-00777)
  - [汉语大字典, p.1829](#): xuán.

According to the cognition, the phonetic component of 滋 is 兹, and the semantic component of 滋 is 兹. So the two characters are phonetically, graphically and semantically different and should be disunified.

Table 1 Information of KP1-4B26

Glyph	Mandarin	IDS	RS	FS	Variant	Source Reference
	xuán		85.9	4	兹 U+7386	KP1-52B4 UTC-00777

By the way, this character can be horizontally extended by G-source as **GHZR-31829.05**.

《說文》：“滋，益也。从水，茲聲。一曰滋水，出牛飲山白陘谷，東入呼沱。”

(一) zī 《廣韻》子之切，平之精。之部。

①增长。《說文·水部》：“滋，益也。”《國語·齊語》：“桓公曰：‘安國若何？’管子對曰：‘修舊法，擇其善者而業

Figure 1 Evidence from 汉语大字典 p.1807

滋 xuán 《廣韻》胡涓切，平先匣。真部。

同“茲”。渫；黑。《玉篇·玄部》：“茲，濁也，黑也。或作滋。”《左傳·哀公八年》：“武城人或有因於吳竟田焉，拘鄭人之漚菅者，曰：‘何故使吾水滋？’”杜預注：“滋，濁也。”陸德明釋文：“滋音玄，本亦作茲，子絲反。《字林》云：‘黑也。’”黃焯彙校：“宋本及何校本、臧校本滋茲互易，是也。”按：《說文·玄部》：“茲，黑也。从二玄。《春秋傳》曰：‘何故使吾水茲？’”段玉裁注：“按《左傳》曰‘何故使吾水茲’釋文曰：‘……本亦作滋，子絲反。’此俗加水作滋，因誤認為滋益字而入之‘之韻’也。《艸部》茲从絲省聲……而茲滋字祇當音懸。”

Figure 2 Evidence from 汉语大字典 p.1829

#### 4 U+FAD1

U+FAD1 杣 is unified with U+233D5 杣 according to [WG2 N2493 = L2/02-232] (U+FADF in file). However, according to the evidences from G-source and K-source, the two characters should be disunified. This pair is also stated in [WG2 N2566] and [WG2 N2573 = L2/02-472].

- ◆ 杣 (GKX-0513.07, T5-264C, J4-2E44)
  - 汉语大字典, p.1248: 柿: fèi, bèi.
- ◆ 杣 (KP1-4B26)
  - 유니코드한자 검색시스템 (Unicode 漢字檢索 System), KC05191: 棣: qiú.

We confirm the existence of fully non-cognate semantic items for two characters, but the book to which we were able to search for evidence (圖解本草) is not in the bibliography list of the KP1-source given in WG2 N2247 = L2/00-289.

Table 3 Information of KP1-4B26

Glyph	Mandarin	IDS	RS	FS	Variant	Source Reference
杣	qiú	𣎵木杣	75.5	1	棣 U+6882	KP1-4B26

By the way, this character can be horizontally extended by K-source as **KC-05191**.

**Universal Multiple-Octet Coded Character Set (UCS) – ISO/IEC 10646**  
**Secretariat: USA**

<b>TITLE:</b>	Proposal to add the 122 compatibility Hanja code table of the D P R of Korea into the CJK Compatibility Ideographs of ISO/IEC 10646-1:2000
<b>SOURCE:</b>	Takayuki K.Sato(Japan),Tatsuo L. Kobayashi(Japan), Pak Tong Gi(DPRK)
<b>STATUS:</b>	Contribution of experts
<b>DISTRIBUTION:</b>	Members of ISO/IEC JTC1/SC2/WG2
<b>DATE:</b>	2002-05-22
<b>REFERENCE:</b>	ISO/IEC 10646-1:2000, ISO/IEC 10646-2:2001, N2478, N2375

We reviewed the proposed Hanja characters of the D P R of Korea thoroughly against existing CJK Compatibility Ideographs block of ISO/IEC 10646-1:2000 and 10646-2:2002 during the WG2 # 42 meeting.

Consequently, we propose to add 122 compatibility Hanjas of the D P R of Korea among the 160 compatibility Hanja code table of the D P R of Korea already proposed into PDAM 2 of ISO/IEC 10646-1:2000. (Table 1)

Remaining 38 characters already mapped in the existing CJK Compatibility Block in the BMP and Plane 2. (Table 2)

# ISO/IEC JTC 1/SC 2/WG 2 N 2573

<p style="text-align: center;"><b>ISO/IEC JTC1/SC2/WG2</b> <b>Universal Multiple-Octet Coded Character Set (UCS) – ISO/IEC</b> <b>10646</b> <b>Secretariat: USA</b></p>
---

<b>TITLE:</b>	Report of DPRK compatibility characters ad hoc meeting
<b>SOURCE:</b>	DPRK compatibility characters ad hoc group
<b>STATUS:</b>	Expert Contribution
<b>DISTRIBUTION:</b>	Members of ISO/IEC JTC1/SC2/WG2
<b>DATE:</b>	2002-12-11
<b>REFERENCE:</b>	<b>WG2 N2375, N2493, N2540, N2541, N2566</b>

During the WG2 meeting #43, DPRK ad hoc group consisting of experts from relevant national bodies was organized to address the issues, primarily raised by the US asking for removal of DPRK compatibility characters from FA70 to FAE9 as part of FPDAM ballot comments.

This is a summary report from the DPRK compatibility characters ad hoc group.

## 1. Errors in FPDAM code table containing 122 DPRK compatibility characters

The group reviewed the document from the contributing editor and confirmed that the corrected code table for DPRK compatibility characters in WG2N2540 is exactly what is intended and should have been used for FPDAM. Those errors in FPDAM code table were introduced during editing process and it doesn't mean the original input from DPRK was unstable.

## 2. Categorization of Comments

The group reviewed 23 characters according to WG2N2566 and 2 characters in US comment (T.8) and found two of them are just a mere mistake in WG2N2566.

As a result of our discussion on the rest of 23 characters, the group addressed four categories of issues regarding these characters.

Type-1: Considering the nature of compatibility characters being used solely for round-trip mapping, we should make use of assigned code positions for compatibility characters of one national standard source for those compatibility characters from another national standard as long as the same unified counter part is shared and there's no confusion for the intended shape.

Type-2: Even if the same shape of a proposed compatibility character happens to be found in existing CJK unified repertoire and its extensions, in principle we should not use the code position in the unified repertoire, or otherwise the normalization information between the intended variant and the unified counter part will be lost.

Type-3: If we find the unifiable shape of a proposed compatibility character in CJK Ext-C candidates and if the Ext-C candidate is considered a new character in terms of unification procedure adopted by the IRG, then the same character should not be encoded as a compatibility character.

Type-4: If a proposed compatibility character is considered a new character in terms of unification procedure adopted by the IRG and it does not appear in the Ext-C candidates, then the character should be proposed as an Ext-C candidate and should not be encoded as a compatibility character.

### 3. Recommendation from the Ad hoc Group

Based on the discussion according to four categories described above, the group recommends removing 15 characters from the original proposal for encoding 122 DPRK compatibility characters and encode the rest of 107 DPRK compatibility characters in 10646-1 Amendment 2.

The list of 15 characters for removal is as follows:

Code positions in WG2N2540	KP code	Category
FA7C	KP1-3A92	Type-1
FA88	KP1-42C8	Type-1
FA8C	KP1-43C1	Type-1
FA8D	KP1-43D2	Type-1
FA93	KP1-45D5	Type-1
FA9C	KP1-4B5D	Type-1
FAA5	KP1-54B7	Type-1
FAB7	KP1-639A	Type-1
FABC	KP1-6725	Type-1
FAD1	KP1-8054	Type-1
FAD2	KP1-80AD	Type-1
FAE1	KP1-57D0	Type-1
FAE6	KP1-78AC	Type-1
FA90	KP1-441D	Type-4
FA9F	KP1-510B	Type-4

More detail information about characters discussed by the ad hoc group is attached in this document.

## **Attachment**

Total # of characters reviewed: 25

### **WG2N2566 errors: 2**

FA96, FA7E

### **C1 candidates: 8**

1. Existing C1 candidates should be unified: 6

The following six characters were claimed to be unified to Ext-C candidates. Ext-C is now under extensive review and the group considered that the corresponding Ext-C candidate characters are suspicious to be remained in the final Ext-C set. The group hence recommends to keep these six characters in DPRK compatibility ideographs.  
(There were no Type-3 characters and therefore all 6 characters should remain in the compatibility character proposal.)

FABB, FA9B, FA86, FAB3, FAAD, FA8A

2. New character proposal (Type-4): 2

The following two characters were claimed to be rather unified ideographs than compatibility ideographs. The group recognized that these two characters are more appropriate as candidates for unified ideographs and recommends to remove from DPRK compatibility ideographs.

FA90, FA9F

### **Ext-B character: 1**

The character FA7D was claimed to be unified with U+20F96. The group considered that, per the unification rule for CJK unified ideographs, suggested unification of FA7D and 20F96 is inappropriate. The group recommends to keep it in DPRK compatibility.

FA7D should not be mapped to U+20F96 (Type-2)

### **Map to plane 2 compatibility characters (Type-1): 13**

The following 13 characters were claimed to be same as those in (pre-existing) compatibility ideographs. The group recognized that each of the following characters is appropriate to be mapped to its corresponding compatibility ideograph in plane 2 and recommends to remove from DPRK compatibility ideographs.

FA7C, FA88, FA8C, FA8D, FA93, FA9C, FAA5, FAB7, FABC, FAD1, FAD2, FAE1, FAE6

### **Compatibility character as in the original proposal: 1**

The following character was claimed to be considered as a candidate for a future extension work of unified ideographs since it cannot be unified with any of existing unified ideographs. The group considered that the following character is to be unified with 233D5 per the unification rule, if it is proposed as a unified ideograph candidate. The group hence recommends to keep the following character in DPRK compatibility ideographs.

FADF

Character by character analyses follow:

### **WG2N2566 errors: 2**

FA96 U+6452 = U+2F8BA

Resolution: WG2N2566 indicates that U+2F8BA is a possible candidate for mapping from KP1-46F9, but they don't share the same unified counter part.

52	擷	KP1-46F9	擷	KP1-4670	U+06452
----	---	----------	---	----------	---------

擷

2F8BA (->U+62FC)

FA7E U+585A => U+585C

Resolution: WG2N2566 indicates the unified counter part of FA7E should be U+585C, but apparently this is a false alarm.

**Title:** Feedback to IRGN2510 Disunification request for 3 characters  
**Source:** Wang Xieyang(王谢杨)  
**Status:** Individual Contribution  
**Action:** To be considered by IRG  
**Date:** 2021-09-02

1. I don't agree to disunify 杮 (U+FAD1) and 杮 (U+233D5). The “杮” in 《图解本草》 is apparently a wrong glyph of “棊” and used orphanly. An orphan wrong glyph can't be the reason of disunification. Provided I find a glyph of “怪” is miswritten as the Japanese glyph of character “径 (U+5F84, 径)”, for example, it is ridiculous that I would disunify 径 from 径.

2. I don't think disunifying 練 (U+FAB0) and 練 (U+7DF4) is a good idea. 《齐文字编》 is a book published in China and 練 is an orphan Lidingzi Character(隶定字) while 練 (U+FAB0) is a KP character in CJKUI. I think it's better if China submit 練 using 《齐文字编》 as evidence in following IRG working sets, but I don't see the necessity.

**(End of Doc)**

Figure 2 U+7DF4

## 2. U+FAD1

From IRG N2510's Figure 5&6, we can't confirm whether the character in IRG N2510's Figure 5 is a variant or an incorrect character. TCA suggest to provide more evidences to make a decision, and then confirm whether we can disunify.

Dr. Lu,

Please post this email as my comments against IRG N2510:

In addition to the comments from Wang Xieyang and TCA, I found two major problems with the proposed disunifications in IRG N2510:

1) The proposed disunification of U+FAB0 from U+7DF4 練 needs to take into account—or at least reference—U+F996 (K-Source) and U+FA57 (J-Source). These two additional CJK Compatibility Ideographs also decompose to U+7DF4 練. The same is true of the proposed disunification of U+FA99 from U+6ECB 滋 that does not reference U+2F90B (T-Source) that shares the same decomposition.

2) All three proposed disunifications involve single-source KP-Source CJK Compatibility Ideographs from the KPS 10721 standard that no one outside of DPRK has ever seen. In other words, the IRG is effectively operating blind when it comes to dealing with issues related to ideographs in this particular standard. If these CJK Compatibility Ideographs were not single-source, that would be another matter altogether.

Until DPRK provides to the IRG copies of their national standards—KPS 9566 and KPS 10721—I would recommend that single-source KP-Source ideographs be placed on a "do not touch" list in terms of disunification. This is more important for the latter standard, because the former one can be glimpsed through ISO-IR-202, though it cannot be considered the actual KPS 9566 standard, and is certainly out-of-date with a registration date of 1998-06-22:

<https://www.itscj-ipsj.jp/ir/202.pdf>

In summary, no meaningful action can be taken on this particular proposal.

Regards...

-- Ken

**Doc Type:** Working Group Document  
**Title:** Response to three feedbacks to IRG N2510  
**Source:** Kushim JIANG (姜兆勤)  
**Date:** 2022-02-17

The document is the response to:

- ♦ [IRG N2510 feedback](#) by WANG Xieyang
- ♦ [IRG N2510 feedback](#) by TCA
- ♦ [IRG N2510 feedback](#) by Ken LUNDE

## 1 Additional Evidence

We found additional evidence for the cognition of the three pairs.

- ♦ 滋 (KP1-52B4)
  - [字典釋要, p.199](#): 滋: 즈
- ♦ 練 (KP1-671B)
  - [大字源, p.1367](#): 練: 련
- ♦ 杣 (KP1-4B26)
  - [字典釋要, p.162](#): 杣: 페

The arrangement of characters in KP1-source also confirms the cognition. According to [SHEN, 2022], characters with the same radical and the same residual stroke count are arranged in phonetic order.

4B23	杣	평	52B1	滄	식	6718	綜	량
4B24	柿	포	52B2	澗	심	6719	綱	량
4B25	椈	피	52B3	滾	쇠	671A	緘	려
4B26	杣	페	52B4	滋	자	671B	練	련
4B27	柶	합	52B5	漣	작	671C	綠	록
4B28	梔	효	52B6	溟	전	671D	綠	록
4B29	栲	화	52B7	準	준	671E	縉	류

Therefore it is reasonable for DPRK to place all the three characters in the compatibility block, and the characters they are unified to are correct too. There is no necessary action for DPRK.

Figure 2 Evidence from 大字典 p.1367

## 2 Cross–regional unification

The main issue of concern in the feedback documents is the cross–regional unification process, which requires a review of existing unification mechanisms.

For each actual shape submitted by each submitter source, its abstract shape can be analyzed using its evidence. As we know from practice, evidence only serves to point out the abstract shape to which each actual shape (and its components) corresponds, regardless of whether it functions as a semantic part or a phonetic part, as long as the abstract shape is the same, they correspond to the same codepoint.

The main questions are:

- ♦ Due to the convention of the region where each submitter source is located, multiple abstract shapes may be analyzed for the same actual shape by different submitter sources, vice versa.
- ♦ The abstract shape of the variant character is poorly defined.
- ♦ The abstract shape of the character with extremely limited evidence (personal name, etc) is poorly defined.

It is difficult for me to make decisions on the complicated actual shape–abstract shape correlation, so here are just a few examples for consideration by experts.

Part one:

- ♦ The G–source actual shape 胶 and J–source actual shape 胶 can be both analyzed as 𠄎{月}{交} and 𠄎{肉(月)}{交}.
- ♦ The pseudo G–source actual shape 耆 (*diǎn*, <耆<耆<耆) can be analyzed as 𠄎{老}{口}, the K–source actual shape 耆 (*nom*) can be analyzed as 𠄎{老}{口}.
- ♦ The pseudo G–source actual shape 𠄎 (Zhuang *boek*) can be analyzed as 𠄎{車}{卜}, the pseudo J–source actual shape 𠄎 (*torakku*) can be analyzed as 𠄎{車}{卜}.

Part two (assume that characters with different writing or structure are analyzed by cognition):

- ♦ The T–source actual shape 𠄎 can be analyzed as {突}.
- ♦ The T–source actual shape 𠄎 can be analyzed as {鲁} and {曾}.
- ♦ The G–source actual shape 𠄎 (*kǎi*) can be analyzed as {𠄎}=𠄎{𠄎}{𠄎}, the V–source actual shape 𠄎 (*lèn*) can be analyzed as 𠄎{𠄎}{了}.
- ♦ The pseudo G–source actual shape 𠄎 can be analyzed as {𠄎}, the SAT–source actual shape 𠄎 can be analyzed as {𠄎}.

**(End of Document)**
