

**Universal Multiple-Octet Coded Character Set**  
**International Organization for Standardization**

**Doc Type:** Working Group Document

**Title:** Proposal to add standardized variation sequence for U+FF10 FULLWIDTH DIGIT ZERO

**Author:** Ken Lunde (Adobe Systems Incorporated)

**Status:** Corporate Full Member Contribution

**Action:** For consideration by the UTC

**Date:** 2017-08-14

**References:** [L2/15-268](#)

**Background**

Discussions of document L2/15-268 resulted in a small number of standardized variation sequences to be added in Unicode Version 9.0, including the following one that is directly relevant to this particular proposal:

0030 FE00; short diagonal stroke form; # DIGIT ZERO

The [Adobe-Japan1-6 glyph set](#), which is used as the basis for hundreds, and possibly thousands, of OpenType Japanese fonts, includes several “slashed zero” glyphs, three of which correspond to <U+0030,U+FE00>. The glyphs are CIDs 230 (proportional upright), 632 (half-width), and 9673 (proportional italic), all of which are unified with U+0030 DIGIT ZERO. Also included in this glyph set is a full-width version at CID+8228 that is a variant of the glyph that maps from U+FF10 FULLWIDTH DIGIT ZERO. The table below shows the corresponding “slashed zero” glyphs from the *Kozuka*, *Meiryō*, *Hiragino*, and *Heisei* typeface families:

Typeface Family	Proportional	Proportional Italic	Half-Width	Full-Width
Kozuka Mincho	0 0̸	0 0̸	0 0̸	0 0̸
Kozuka Gothic	0 0̸	0 0̸	0 0̸	0 0̸
Meiryō	0 0̸	0 0̸	0 0̸	0 0̸
Hiragino Mincho	0 0̸	0 0̸	0 0̸	0 0̸
Hiragino Kaku Gothic	0 0̸	0 0̸	0 0̸	0 0̸
Heisei Mincho	0 0̸	n/a	0 0̸	0 0̸
Heisei Kaku Gothic	0 0̸	n/a	0 0̸	0 0̸

\* Also included in this glyph set are pre-rotated versions of these three glyphs at CIDs 8949 (CID+230), 9081 (CID+632), and 13189 (CID+9673) that are referenced by the effectively-deprecated OpenType 'vrt2' GSUB feature.

## Proposal Summary

This document proposes to add the following single standardized variation sequence whose description follows that of the one that uses U+0030 DIGIT ZERO as its base character::

FF10 FE00; short diagonal stroke form; # FULLWIDTH DIGIT ZERO

## Rationale, History & Conclusion

Virtually all Japanese fonts include the glyph that corresponds to the full-width slashed zero, and all of the forms that are shown in the table of the first page of this document were accessed via the OpenType 'zero' GSUB feature.

Full-width digits and Latin characters are often used in Japanese text, and any such string that includes a mixture of such characters has the potential to require the digit zero to be visually distinct from U+FF2F FULLWIDTH LATIN CAPITAL LETTER O, whose glyph may exhibit a similar or identical shape, depending on the typeface design. This is similar to the use cases that benefit from the existing <U+0030,U+FE00> standardized variation sequence.

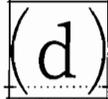

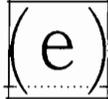

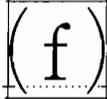

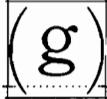

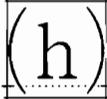

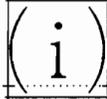

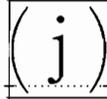

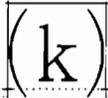

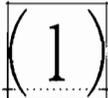

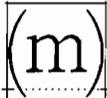

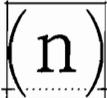

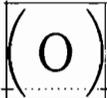

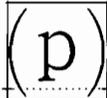

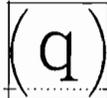

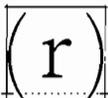

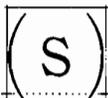

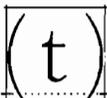

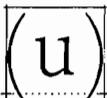

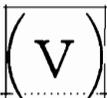

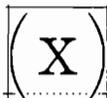

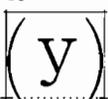

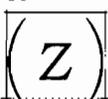

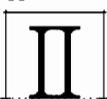

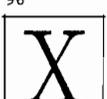

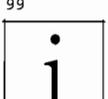

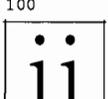

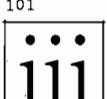

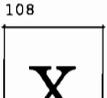

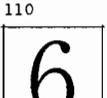

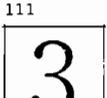

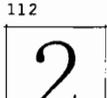

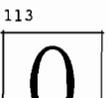

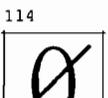

Compatibility decomposition for U+FF10, which can affect the full-width characters in the [Halfwidth and Full-width Forms](#) block, is no worse than other full-width characters in the same block, and will still render as a “slashed zero” form of U+0030 as a result of the existing <U+0030,U+FE00> standardized variation sequence, as long as both UVSeS (*Unicode Variation Sequences*)—<U+0030,U+FE00> and <U+FF10,U+FE00>—are specified in the selected font’s Format 14 'cmap' subtable and resolve to a “slashed zero” glyph.

In terms of history, the inclusion of the full-width “slashed zero” glyph in Adobe’s Japanese glyph set extends back to the late 1980s, before I joined Adobe in mid-1991, and is due to Morisawa, Japan’s leading type foundry, including this particular glyph in their very first two PostScript Japanese fonts, *Ryumin-Light* and *GothicBBB-Medium*, and in all subsequent fonts.

This glyph was first documented in [Adobe Technical Note #5031](#), *Kanji Glyph Collections And Glyph Sets*, which is dated 1990-11-12, and is shown on page 165 as the glyph named *zeroslash* in Collection 8, *Full-width and Half-width Face-specific Symbols* (see the following page for a scan of the entire page). In terms of composite font organization, this glyph was included in the *AlphaNum* row font of the *Symbol* PG group. When the Adobe-Japan1-0 glyph set was defined in the early 1990s, this glyph was included as CID+8228.

Accepting this new standardized variation sequence will help to bring parity to the full-width “slashed zero” glyph that is present in virtually all Japanese fonts, which also include glyphs that correspond to the existing <U+0030,U+FE00> standardized variation sequence.

That is all.
